FACULTY OF LAW

DOCTORAL DISSERTATION

Big Data and Artificial Intelligence

An examination of the existing legal framework from a data protection
perspective

AUTHOR: Branka MANIA

SUPERVISOR: Dr. Gergely SZŐKE

PÉCS 2023

Abstract

This dissertation examines the legal framework for Big Data and Artificial Intelligence from a data protection perspective. This research aims to contribute to the body of knowledge with regards to present and future legal conditions applicable to the processing of personal data in the context of automated and algorithmic data processing systems. The approach taken was to explain characteristics and identify various potential risks of Big Data and AI, and to provide a comprehensive overview of the existing and proposed legal regime that applies to the processing of personal data when novel technologies are used with a focus on but not limited to the General Data Protection Regulation. The investigation of legal resources showed that the regulation of automated or algorithm-based data processing is not in its infancy, and that existing data protection laws address issues that arise out of the use of Big Data and AI. It also demonstrated challenges and limitations of traditional concepts such as transparency and privacy self-management, and discussed whether and how they could be further developed, including new control mechanisms which may be based on numerous international initiatives that have provided expert guidance and recommendations for the use and regulation of AI.

Ez a disszertáció a Big Data és a mesterséges intelligencia jogi kereteit vizsgálja adatvédelmi szempontból. A kutatás célja, hogy hozzájáruljon a személyes adatok automatizált és algoritmus alapú kezelésére vonatkozó, jelenlegi és jövőbeli jogi szabályozással kapcsolatos ismeretanyaghoz. A dolgozat célja a Big Data és a mesterséges intelligencia jellemzőinek ismertetése és a különböző potenciális kockázatok azonosítása, valamint átfogó áttekintés nyújtása a személyes adatoknak az új technológiák keretében történő feldolgozására vonatkozó jelenlegi és javasolt jogi szabályozásáról, különös tekintettel, de nem kizárólag az általános adatvédelmi rendeletre. A felhasznált források vizsgálata kimutatta, hogy az automatizált vagy algoritmusalapú adatfeldolgozás szabályozása részben kidolgozott, a meglévő adatvédelmi jogszabályok is foglalkoznak a Big Data és a mesterséges intelligencia alkalmazásából eredő kérdésekkel. Bemutatta továbbá az olyan hagyományos fogalmakkal kapcsolatos kihívásokat és korlátokat, mint az átláthatóság és az adatvédelmi önszabályozás, és javaslatot tett arra, hogy ezeket hogyan lehetne továbbfejleszteni, beleértve az új ellenőrzési mechanizmusokat is. Ezek számos olyan nemzetközi kezdeményezésen alapulhatnak, amelyek iránymutatást és ajánlásokat adtak a mesterséges intelligencia felhasználására és szabályozására vonatkozóan.

1. Introduction, hypotheses, and methodology

1.2. Introduction

From a business perspective, the use of algorithmic data processing systems is very attractive as it allows for time and cost efficiency as well as real-time insights, detailed analytics, and forecasting. From an individual's perspective, the use of Big Data, automated decision-making, and Artificial Intelligence (AI) may lead to a variety of consequences: complex data processing operations which are performed by self-learning machines that are solely based on data-driven predictive models may not be transparent anymore. Any such processing is thus potentially opaque and may lack human oversight and could lead to secondary and unpredictable use of personal information, (secret) scoring and profiling, or may even have the potential for discrimination or surveillance. These effects can pose serious threats to individuals' chances in life as nowadays, housing, loan or job decisions are often taken with the help of AI systems. Privacy self-management seems hard to achieve given the lack of choices, market dominance, imbalance of powers or information mismatch between data subjects and controllers. From a data protection perspective, these circumstances together with effects like data aggregation and maximization or derivative use of personal information may contradict with common principles of data protection laws such as lawfulness, fairness, transparency, or purpose limitation and accountability. This in turn leads to the question what the current legal framework looks like given the various implications that go with the use of algorithmic technology. To answer this question, the characteristics, benefits, use cases and especially risks of Big Data and Artificial Intelligence must be assessed, as well as the existing legal framework that applies to the algorithmic, autonomous, probabilistic, data processing and decision-making that is based on personal, user, behavior, sensor, etc. data. The evaluation included further relevant sources of law such as product, trade, security, liability, or data and processing specific rules at international, European, national, or sectoral level to complete the picture about existing regulatory conditions in this context and to provide a global overview because data processing does not stop at borders. The research focused on the General Data Protection Regulation since it is a role model law for many other jurisdictions and elaborated on the legal situation in the U.S. because the U.S.A. are home to all relevant Big Tech players, meaning that any applicable local privacy or consumer protection laws de facto have global impact. As regards the viability of traditional concepts in data protection laws and whether these approaches capture novel risks of AI, the Thesis elaborates on challenges of transparency and privacy self-management and phenomena like fragmentation and the shifting of the protection of fundamental rights. It concludes with a comprehensive outlook on legislative, regulatory, or non-governmental proposals and expert guidelines that have been suggested for the regulation of Artificial Intelligence to identify recurring motifs and statements that may serve as a basis for a future-proof regulation of AI. Artificial Intelligence has the potential to shape our lives in good and bad ways like

the case of Clearview AI¹ or the role of AI in medicine² demonstrate. At the same time, the use of Big Data, ADM, and AI pose various data protection risks, and that is why this research topic is valuable from a scientific point of view.

1.2. Hypotheses

Within the framework of this Thesis, the following three main hypotheses are formulated: first, privacy self-management failed for a variety of reasons. In many instances, it deteriorated into a mere click-mechanism, a take-it-or-leave-it-approach, a repetitive element in data-for data-services-business-models. Privacy self-management requires valid consent, but that is difficult to imagine given the information asymmetries and imbalances between parties. Current data subject rights such as the right to right to information, the right to withdraw consent, the right to object, or the right to restrict data processing do not result in explainability of processing operations or reproducibility of decisions, which may perhaps be needed to take informed decisions and properly exercise individual rights. Depending on the circumstances, secondary use of personal information may be admissible, or processing may be privileged for various reasons, leaving little space for the exercise of such rights. In consequence, privacy self-management does not lead to the desired protections, especially not in an era in which is characterized by the inconsistency between peoples' opinions on the relevance of privacy and their actual behavior, for example, by accepting so-called ambient intelligence³ and luxury surveillance⁴ which enable constant monitoring and analysis of activities and behavior. Second, the transparency principle needs to be further developed, moving away from lengthy one-time notices that address individuals that are written by lawyers for lawyers in the direction of comprehensive, meaningful, and appropriate⁵ information, towards publicity obligations that address a wider audience. Even if information is provided in a compliant manner, individuals are often overwhelmed with privacy notices,

¹ What used to be the preserve of law enforcement identification services and subject to judicial review, became a flourishing private sector service, see Samuel Stolton: After Clearview AI scandal, Commission 'in close contact' with EU data authorities. Article published February 12 2020, available at <https://www.euractiv.com/section/digital/news/after-clearview-ai-scandal-commission-in-close-contact-with-eu-data-authorities/>. Retrieved September 26, 2021.

² What used to be the preserve of physicians and surgeons who have studied and trained for many years, became a use case for diagnostics or robot surgery and promises to revolutionize patient care, see MedTech Europe, the European trade association for the medical technology industry including diagnostics, medical devices and digital health provides background information on AI in the health sector on their website, available at <https://www.medtecheurope.org/resource-library/ai-in-medical-technologies/>. Retrieved July 22, 2022.

³ Ambient intelligence is a term that describes a technology where devices are not perceived as they slip into the background, but they are "always on", meaning that they constantly collect (sensitive) information, see Diane Cook, Juan Augusto, Vikramaditya Jakkula: Ambient intelligence: Technologies, applications, and opportunities. Article published in Pervasive and Mobile Computing 2009, vol. 5, issue 4, pp. 277-298, available at <https://www.sciencedirect.com/science/article/abs/pii/S157411920900025X#:~:text=Ambient%20intelligence%20is%20an%20emerging%20discipline%20that%20brings.and%20sensor%20networks%2C%20pervasive%20computing%2C%20and%20artificial%20intelligence>. ⁵ That means ad hoc and repetitive, see GDPR Art. 13 III.

and transparency obligations are limited, not only because of trade secrets.⁶ Information on the underlying logic of an algorithm is not the same as explainability of the processing or replicability of the decision in question, and information addressed to concerned data subjects is not the same as, for example, general labeling obligations when humans interact with AI irrespective of legal or other significant effects, or public AI registries that allow for better access to relevant information such as details on risk evaluations, or information on sub-processors: making true operators known could truly help with clarity on controllers and their accountability share. Such duties could increase the chances for the needed awareness and social debate, which is an important instrument as it allows for better insight into how algorithmic apps can be used like the case on leaks on Meta's practices has proven,⁷ and it could furthermore foster individual engagement, which is a factor that should not be underestimated as a single person's commitment has brought down an entire mechanism for international data transfers. Third, new controls are needed on top of existing standard documentation, self-evaluation, and vendor management requirements. In the context of new controls, ideas range from mandatory external assessments and auditing requirements, monitoring of AI systems, and the formation of specialist independent oversight bodies with simplified coherence mechanisms, including the right to issue orders against any processor and manufacturers to capture all players. Further suitable concepts could be the introduction of specific technical standards, the use of synthetic data, the use of sandboxes, or a standardization of testing procedures because poor data quality and errors in the design of AI apps may lead to bias and discrimination. New data subject rights such as having personal information replaced rather than having the processing restricted could be a more effective way to avoid re-identification. There are also debates about data ownership to fight data monetization, but it is questionable how that may work in practice, however, contractual limitations of the use of personal data are not unimaginable given that service-for-data is a well-established business model, but at present, it is strictly unilateral. From an individual's perspective, the right to participation and the right to human intervention as well as enhanced redress mechanisms and a broader right of action for consumer protection and competition authorities could be useful to successfully enforce individual's rights. AI's capability for surveillance⁸ and its potential impact on human rights⁹ makes it worthwhile to think about mandatory human rights impact assessments and the introduction of further principles such as non-

discrimination and inclusion, equality and diversity that should be applied whenever algorithmic processing is in question. The mass application of Big Data, AI and automated decision-making not only affects individuals but society, and digital workforce aspects show that there is an important intersection between individual rights and societal values. Consequently, new values shall not only be judged at data subject level but consider the societal perspective and therefore include public safety and termination obligations in the event AI gets out of control. A repetitive request in the context of taking a human-centric approach that serves society is the demand to embed ethics into Big Data, ADM, and AI. But ethics are an ambivalent requirement because the interpretation of ethically acceptable standards may vary, and ethics may moreover serve as an escape from regulation.¹⁰ While it is comprehensible that industry may prefer a deregulated landscape for novel technology claiming that regulation stifles innovation, self-regulation has not proven to work: “legislative history in the course of industrial revolutions and across various sectors, be it transportation, chemical engineering, communications, aviation or biotechnology and digitization has shown that voluntary codes or self-regulation may simply not work, and that regulatory discussions should not primarily focus on specific harms or individual risks but also take the systemic and structural risk of AI into consideration.”¹¹ The dominating perception of AI is its huge positive impact in operations, analytics, or medicine, but what is often overlooked is that Artificial Intelligence also has a remarkable potential for malicious use. Risks are growing¹² as fast as processing capabilities: with today’s technology, a single photo is enough to create a Deep Fake to embarrass or blackmail somebody;¹³ biometric data taken from public events can be used to fool security systems to gain illegitimate access to systems and data,¹⁴ or to exploit human vulnerabilities by using speech synthesis for impersonation.¹⁵ Already today, AI is incorporated in slaughter-bots,¹⁶ and it is therefore incomprehensible why this technology should be treated in a different manner than any other technology for which imminent high risks have been identified such as autonomous vehicles, weapons,

or nuclear power.¹⁷ Consequently, many recognize the necessity to draw red lines¹⁸ and therefore insist on prohibitions of certain AI, for example, Artificial Intelligence that is used for secret profiling, social scoring, or facial recognition. An important conclusion therefore is that algorithmic accountability is needed, ideally, with a specific liability regime in the style of product liability and consumer protection regulations.

1.3. Methodology

To examine whether the legal and regulatory framework captures and matches possible risks involved in the use of novel technology such as Big Data and AI applications, the Thesis first takes a descriptive approach by explaining the history of data privacy and emergence of data protection laws and what they aim to protect. The Thesis then explains the main unique properties of Artificial Intelligence and explores on various potential risks that come with the use of this novel technology. In the context of the examination of existing laws, the Thesis starts with legal definitions which are relevant for the scope and applicability of laws and elaborates on numerous laws and regulations that include data protection provisions, be it on international, EU, sectoral or national level. The Thesis takes a systematic, analytical, and critical approach by identifying relevant legal and regulatory sources globally, including a variety of legislative as well as civil society and private sector proposals for the future regulation of AI. The Thesis provides introductory notes as well as brief summaries for each chapter and concludes with a comprehensive summary of findings with are relevant for the hypotheses.

2. History of privacy, development of data protection laws and the emergence of Big Data, Automated Decision Making, and AI

As an introduction to the Thesis topic, this chapter provides a brief history of the right to privacy and explains the development of data protection laws by illustrating the foundations of the right to privacy, and relevant legislative developments in recent decades. This chapter furthermore deals with the emergence of Big Data, automated decision-making, and Artificial Intelligence owing to technological progress to demonstrate the relevance of AI in today's world.

2.1. Brief history of the right to privacy

It is difficult to say when exactly the first ideas on the right to privacy came up. Some years ago, the Bavarian State Commissioner for Data Protection¹⁹ organized an exhibition called “From the oath of Hippocrates to Edward Snowden: a short journey through 2500 years of data protection”.²⁰ This title shows that the origins of data protection – or at least some aspects like patient confidentiality – are much older than one would suggest, and this does not only apply to the medical field: first basic ideas about privacy came up in the late Middle Ages and the early Renaissance: the confessional secret dates back to the fourteenth century and the banking secrecy dates back to the sixteenth century.²¹ However, there were times in which, apart from any legal protection, even walls and single beds were regarded as a means of privacy.²² Already in 1890, two lawyers from the United States, wrote an Article called “The Right to Privacy”,²³ in which they argued that laws must be adapted to reflect technological change due to the increasing capacity of certain institutions to invade previously inaccessible aspects of personal activity. They defined the protection of the private as the foundation of individual freedom in the modern age and concluded that legal remedies had to be developed to enforce definite boundaries between public and private life.²⁴ Later on in his career as a judge, one of the authors explained²⁵ that the right to be let alone as the most comprehensive of rights. Basic concepts of respecting the right to privacy were set out around 1950, decades before computer usage grew exponentially: in 1948, the United Nations proclaimed the Universal Declaration of Human Rights in 1948 response to World War II.²⁶ The Universal Declaration of Human Rights sets out, for the first time, fundamental human rights to be

universally protected, and this includes privacy.²⁷ Only two years later, the European Convention on Human Rights was adopted, and it included the right to respect for private and family life.²⁸ In addition, the EU enacted the Charter of Fundamental Rights of the European Union²⁹, and the specialty about this charter is that it explicitly also addresses the protection of personal data.³⁰ It is remarkable that the respect for private life and the right to data protection emerged much earlier than mass processing of personal data. It is also notable that even in specialist circles,³¹ the Universal Declaration of Human Rights, the Charter and the Convention are sometimes better known or maybe even more recognized than the 1981 Council of Europe Data Protection Convention (108+).³² This is not comprehensible insofar as this convention formulated several basic principles which are still valid today, for example, that personal data shall be processed lawfully, fairly and in a transparent manner and that personal data shall be accurate and kept up to date and collected for explicit, specified and legitimate purposes and not processed in a way incompatible with those purposes.³³ In addition, this convention is the only legally binding multilateral agreement in the field of personal data protection³⁴ - unlike the 1980 OECD guidelines on the protection of privacy and trans-border data flows of personal data, which are nonetheless a very important³⁵ contribution to the overall data protection framework. It can therefore be said that, in the time-period between World War II and the early 1980s, important (binding) international statutes have been created.

²⁷ UDHR Article 12 stipulates that “no one shall be subjected to arbitrary interference with his privacy, family, home, or correspondence nor to attacks upon his honor and reputation. Everyone has the right to the protection of the law against such interference or attacks”.

2.2. Development of data protection law

As far as national legislation is concerned, some sources³⁶ claim that the 1973 Swedish Data Act was the world's first national data protection law. However, the Hessian Data Protection Act was passed in 1970³⁷ and may therefore be considered the first data protection law in Europe. It can generally be said that the first generation of data protection norms appeared in the 1970s, which is also true for the U.S. as the 1970 Fair Credit Reporting Act³⁸ contained elements of data protection. Another example is the 1972 amendment of the Californian Constitution³⁹ which established an enforceable right to privacy including the ability of individuals to control the use and / or sale of their personal information, or the 1974 Privacy Act which established a code of “fair information practices that governs the collection, maintenance, use, and dissemination of information about individuals that is maintained in systems of records by federal agencies.”⁴⁰ This first statutory codification wave did not use terms like privacy and was rather concerned about the state sector and public authorities. Well-known concepts such as technical and / or organizational rules for processing were included.⁴¹ Apart from security safeguards, basic concepts such as transparency and principles which govern the collection, use, and dissemination of information about individuals including the right to individual participation were introduced not only in Europe, but also in the U.S. based on the so-called Fair Information Practice Principles (FIPP).⁴² Even though there is no comprehensive federal data protection act covering the private sector in the U.S. until today,⁴³ many FIPP principles have been fully or partially implemented in specific laws,⁴⁴ and there are important sector-specific and / or business-model relevant regulations like the 1998 Children's Online

Privacy Protection Act⁴⁵ (COPPA) and the 1996 Health Insurance Portability and Accountability Act (HIPAA).⁴⁶ Already in 1967, the Freedom of Information Act (FOIA) came into effect in the U.S. which provides individuals with the right access documents from state agencies.⁴⁷ It is important to note, however, that the greatest difference between the U.S. and the EU approach to data protection is that, under European law, a legal basis is always required for the processing of personal data, whereas in the US, the contrary is true, because data can generally be processed unless a law specifically forbids such an activity.⁴⁸ It can therefore be said that, within the EU, the most important data protection rule is that a prohibition (of the collection, of the use) of processing applies which is subject to permission (by law, by individual consent). Further European countries passed their data protection bills in the late seventies, e.g., France in 1978, Luxembourg in 1979, and other countries like Portugal, Belgium and Spain followed later on in 1991 and 1992.⁴⁹ The second generation of data protection laws emphasized data subject rights, and the idea behind that was that the individual may be the best guarantee for successful enforcement of data protection laws.⁵⁰ In 1983, the German Federal Constitutional Court issued a decision⁵¹ regarding the collection of personal information collected during the 1983 census. Ever since, this decision is considered a milestone of data protection as it introduced the concept of so-called “informational self-determination” and introduced a new fundamental right. In this decision, the court dealt with the question whether individuals themselves shall be able to determine collection, storage, use or disclosure of their data to others. Even though it is not the same, in this respect, the decision is similar to the concept of the “right to privacy” in the United States legal tradition. The protection of privacy, the right to a private life, the protection of personal data, or the right to public sector information all fall under the umbrella of informational self-determination.⁵² The court explicitly linked these matters to constitutional rights – an idea which is one of the characteristics of the third generation of data

protection norms.⁵³ The UK passed its data protection law in 1984, and Italy and Greece waited for the corresponding EU directive, thus avoiding the need to (re-)shape their national laws accordingly.⁵⁴ The fourth generation of data protection laws, among other things, abandoned the idea that only automated data processing requires protection⁵⁵ and introduced more detailed rules, for example for sensitive data,⁵⁶ and sector-specific regulations, for example for credit-reporting agencies.⁵⁷ The mid-nineties were the starting point of a new law regime with regards to data protection for the European Union: The Data Protection Directive⁵⁸ was created in 1995 and introduced new terms like sensitive personal data and consent. In 2002, the EU adopted a Directive on Privacy and Electronic Communication,⁵⁹ and in 2009, the EU established an electronic communications regulation⁶⁰ in response to the fact that individuals' contact details such as email addresses and mobile numbers became a prime currency in conducting marketing and sales.⁶¹ The EU also brought forward a Directive on Data Retention⁶² in 2006, however, this directive was declared invalid by the European Court of Justice in 2014 for violating fundamental rights. In the year 2014, the CJEU delivered another significant ruling:⁶³ the so-called Google Spain decision was about the possibility to demand that a search engine operator removes certain query results, a decision that was often quoted⁶⁴ as the right to be forgotten. Finally, after years of intensive

discussions, the General Data Protection Regulation was approved in 2016. The Internet, the growing digitalization, new techniques and (social media) platforms as well as the increasing trans-border nature of data processing made data protection more and more an international topic, which led to an increased interest in the possibility of regulating data protection at an international level.⁶⁵ Given the overall dynamics of the topic, the evolution of data protection rules cannot be considered completed.

2.3. Emergence of Big Data, Automated Decision-Making, and Artificial Intelligence

Big Data and AI both represent the search for knowledge, and they are founded on a variety of disciplines such as logic, mathematics, and statistics: logic is the foundation for understanding parameters, mathematical thinking is critical for the explanation of input and outputs, and statistics allow for interpretation and evaluation through analysis. The evolution of Big Data and AI clearly goes hand in hand with the development of computer science: obviously, the speed of processing and cost efficiency of the needed infrastructure play an important role for the development of Big Data and AI. Notwithstanding quantum leaps in the area of Artificial Intelligence in the last decade, the first concept of Machine Learning dates back to the eighteenth century when Bayes developed a framework for reasoning about the probability of events known as the Bayesian inference; in the nineteenth century, Boole worked on logical reasoning, and in 1914, the first chess-playing machine that operated without human intervention was invented.⁶⁶ The starting point of data processing was perhaps the year 1889 when the first system which could read holes punched into paper cards was introduced.⁶⁷ As regards Big Data applications, the first approaches to modern⁶⁸ Big Data analysis⁶⁹ are probably almost one hundred years old: In 1927 an Austrian-German engineer developed a means of storing information magnetically on tape,⁷⁰ and the German “Schutzgemeinschaft für Absatzfinanzierung”⁷¹ based its decisions on a system for assessing payment behavior,⁷² which became the foundation for Germany’s first credit

agency,⁷³ an important use case for Big Data analytics and scoring in the financial sector.⁷⁴ The first major data project had been created in 1937 and was ordered by the Roosevelt administration in the US, because, after the Social Security Act was enacted, the government had to keep track of data of millions of employees.⁷⁵ In 1941, the world's first fully automatic, general-purpose digital computer Z3 became operational; his inventor is nowadays considered a pioneer of computer science,⁷⁶ but given the overall circumstances of the 1940s and World War II, the potential of his work was not recognized and remained largely unnoticed.⁷⁷ The 1940s saw several groundbreaking publications in the field of Artificial Intelligence: McCulloch and Pitts 1943 article “A Logical Calculus of the Ideas Immanent in Nervous Activity” that become the inspiration for neural networks, Berkeley’s 1949 publication “Giant Brains Or Machines That Think” about machines that can handle information with speed and skill similar to what a brain would be if it were made of hardware and wire instead of flesh and nerves,⁷⁸ and in 1950, Turing published his famous essay “Computing Machinery and Intelligence”.⁷⁹ However, at that time, Turing did not have the resources needed to translate his vision into action.⁸⁰ Not only technological progress, but political and strategic factors were reasons for the further development of computers: during World War II, the UK was intensively working to crack Nazi codes and they developed a machine called Colossus⁸¹ which scanned for patterns in encrypted messages. Shortly after World War II, the National Security Agency was founded in the US, and they were also assigned the task of decrypting messages.⁸² Many consider the 1956 Dartmouth summer research project the birth of the field of Artificial Intelligence where essential ideas behind AI have been investigated, i.e. ways in which

machines could be made to simulate aspects of intelligence.⁸³ Apart from McCarthy, many other scientists researched on the concept of engineering machines to independently execute commands in the 1950s, e.g., Samuel who coined the term “Machine Learning”; Rosenblatt who developed an early artificial neural network called “Perceptron”, or Simon and Newell who worked on one of the first AI programs called the “Logic Theorist”.⁸⁴ Computers of this time reached a point where they could operate independently and collect and process data automatically.⁸⁵ In 1950, Claude Shannon built a small remote-controlled robotic mouse called “Theseus” that could navigate within a labyrinth,⁸⁶ and in 1961, the first industrial robots⁸⁷ have been introduced.⁸⁸ In 1965, Feigenbaum and colleagues engaged in building the first knowledge repository tailored for specialized domains called “DENDRAL”, which is considered the first expert system since it automated the decision-making process and problem-solving behavior of organic chemists.⁸⁹ Also in the mid-1960s „ELIZA”, an interactive program that was capable of dialogue was developed,⁹⁰ and in the following years, further progress was made in the area of Robotics, for example with the development of the famous robots named “Shakey”⁹¹ and “Freddy”.⁹² The 1970s were the era of the personal computing revolution: the first personal computers with floppy-drives as key components emerged: in this regard, many think of IBM or Microsoft, but the first personal computers have been introduced by other companies and came as kits, e.g., the MITS Altair 8800 or the

IMSAI 8080.⁹³ Despite promising ideas and approaches in previous decades, the era of the 1980s showed that there are gaps between theory and practice which resulted in little significant practical successes and lesser interest in terms of research and funding,⁹⁴ so that some describe this time as the winter of Artificial Intelligence.⁹⁵ However, another novelty paved the path forward: in 1989, the World Wide Web was invented,⁹⁶ and the 1990s saw major advancements in all relevant areas of AI, from reasoning and scheduling over data mining and natural language processing to gaming and visual reality, mainly because fundamental limits of computer storage yielded to new hardware innovations.⁹⁷ As of the mid-90s, a remarkable (exponential) growth of computing performance took place,⁹⁸ and performance and storage power as well as rate at which data is growing are key factors for Big Data, and this rate does not seem to slow down as more and more individuals⁹⁹ as well as devices¹⁰⁰ are interconnected. In the following years, AI applications became more sophisticated: in 2010, an early deep learning system called AlexNet, a neural network with many layers, was able to recognize images of objects near human-level,¹⁰¹ and by now, image recognition capabilities of AI systems have developed very rapidly – moving from image recognition to image generation,¹⁰² and the same is true for language generation capabilities of AI.¹⁰³ Language capabilities of AI are so advanced that AI even wrote a law for the regulation of AI regulation.¹⁰⁴ In late 2022 OpenAI released “ChatGPT”, a language model for dialogue the company

perspective.¹¹⁴ Research has pushed so far as to store information in DNA.¹¹⁵ “DNA molecules can store up to 215 petabytes, or 215 million gigabytes, of data in a single doubled stranded molecule, making it one of the highest storage density mediums in the world (... which is much more) than we can currently create, so there has been a lot of focus in trying to harness the power and data storage capabilities of DNA for our (...) data storage systems.”¹¹⁶ Scientists are even working on “Organoid Intelligence” by creating AI that uses real human cell brains.¹¹⁷ While AI may help to solve challenges in science and reshape medicine,¹¹⁸ it may also be used to keep the world under watch.¹¹⁹

This chapter elaborated on the history of the right to privacy, it explained that the first data protection laws have already been enacted more than fifty years ago, and illustrated relevant legislative developments in recent decades in Europe and in the U.S. Even though there is no comprehensive federal data protection law in the U.S.A., Fair Information Practice Principles have been formulated and implemented in sector-specific laws such as the 1998 Children's Online Privacy Protection Act or the 1996 Health Insurance Portability and Accountability Act, which are laws that are still in force today. This chapter furthermore dealt with the emergence of Artificial Intelligence whose foundations date back to the 1950s when first attempts have been made to create machines that could simulate aspects of intelligence. As of the 1990s, the substantial growth of computing performance paved the way for Big Data and AI as we know it today, resulting in both, fascinating technology such as Quantum Computing or frightening types of Artificial Intelligence such as Deep Fakes.

3. Definitions

This chapter deals with definitions of relevant legal terms. The examination of the legal terminology is essential because the definition of legal terms is decisive for the scope and applicability of laws. The challenge already starts with the broad definition of the term personal information which tempts some to speak of data protection law as the law of everything. Since terms like pseudonymous and anonymous

data, consent as well as profiling, automated decision-making or scoring are part of the existing legal framework, the regulation of novel technologies may not be in its infancy as some claim, meaning that existing data protection laws address Big Data, ADM, and AI. This section furthermore illustrates the discussion around the terms data protection and privacy, which are often used interchangeably. The debate is highly valuable to examine the question what data protection and data privacy protect and to determine whether present definitions are future-proof. The chapter concludes with challenges of legal terminology, including interpretation, and translation issues as well as background on the terms risk and harm which are important for the legal approach: rights-based, risk-based, or control-based.

3.1. Definition of privacy

As opposed to the “protection of fundamental rights and freedoms of natural persons and in particular their right to the protection of personal data”,¹²⁰ there is no appearance of the term privacy in GDPR. It is hence unclear what exactly is meant by privacy, so to speak the essence of what is to be protected: is data protection a subset, an expression of the right to privacy, or does it provide additional protection?¹²¹ Existing legal bases are not helpful: the term privacy appears frequently, e.g., in the United Nations Universal Declaration of Human Rights¹²² or the OECD Privacy Guidelines as well as various other resolutions and guidelines at international level. Other norms operate with terms such as private and family life,¹²³ but there is no universal definition of privacy. Current legislation does not offer a conclusive definition of the term privacy or private data; data protection is thus rather achieved through the regulation of the conditions under which personal data may be processed.¹²⁴ If privacy is about the right to keep personal matters and relationships secret¹²⁵ and being apart from company or observation,¹²⁶ then privacy is about separating private from public life. Given that this depends on the era, the degree of technical development as well as the social and cultural environment of the individual, it is comprehensible that the concrete idea of privacy differs and develops, and the notion of privacy as we know it has only emerged in the past 150 years.¹²⁷ Perhaps a suitable and catchy definition of privacy

would be “control over knowledge about oneself”,¹²⁸ but the problem is that data subjects do not exercise control as the so-called privacy paradox shows, and moreover, it is quite often not possible to predict in advance which personal information will be claimed as private, since such claims are made on an ex post facto basis and also depend on contextual factors.¹²⁹ Social media is a good example for the shift of private life to public as, some years ago, it would have been unimaginable to share so many private details with so many people. The unanimity with which the claim for privacy is represented stands in contrast to the diversity of answers to the question of which value(s) should actually be protected.¹³⁰ In this regard, some pursue the idea of data ownership, others stress informational self-determination or emphasize defense against surveillance or the instrumental character of data protection as risk prevention, while others are primarily concerned with combating power asymmetries between organizations (state, companies, service providers) and individuals (citizens, customers, patients, clients).¹³¹ Numerous attempts to define privacy failed because the definitions were too narrow or too broad or because they focused on certain aspects, but some authors developed characteristics of privacy such as the right to be let alone, the control of personal information, limited access to the self, as well as secrecy and intimacy.¹³² Others discussed levels that affect privacy such as the political, the socio-cultural and the personal level:¹³³ they defined the right to privacy as the right of individuals to determine for themselves when, how, and to what extent information about themselves is communicated to others, including when such information will be obtained and what uses will be made of it by others. Some bills¹³⁴ identify privacy as a fundamental right – and “an essential element of freedom”, meaning that individuals’ freedom is core of the legislative intent. Moreover, technology must be taken into consideration as well to grant protection not only by the state or authorities, but also by businesses which process personal data: GDPR embraces this idea by setting standards for data protection by design and

by default in GDPR Article¹³⁵ 25. Perhaps a contemporary definition of privacy is the absence of harmful use¹³⁶ with regards to the individuals concerned with the data processing – an idea that is consistent with the Regulation’s risk-oriented approach and the fact that the production, collection, and use of data is growing at fast pace, which is why some declare the regulation of data collection to be a losing battle.¹³⁷ The difference between privacy and data protection needs to be clarified, because these terms cannot be considered identical even though they are quite often used interchangeably. The terms can have different meanings depending on context, industry, or jurisdiction: There are two systems which ensure the protection of fundamental human rights in Europe, the European Convention on Human Rights (Convention) and the Charter of Fundamental Rights of the European Union (Charter). The protection of personal data and privacy are closely linked in the jurisprudence of both, the European Court of Human Rights (ECtHR)¹³⁸ and the Court of Justice of the European Union (CJEU), but their personal and substantive scopes diverge:¹³⁹ Article 8 of the Convention and Article 7 of the Charter stipulate that everyone has the right to respect for private and family life, home and communications, and Article 8 of the Charter specifically deals with protection of personal data. This shows that privacy and data protection are not the same. The General Data Protection Regulation is, as the name says, about data protection, and given the numerous duties processors must implement,¹⁴⁰ one may say that data protection is about a (management) system of data processing practices for the protection of privacy, meaning that companies ensure protection whereas individuals ensure privacy by controls to which they are entitled as data subjects. Privacy includes private and family life, home and correspondence. It is a recognized fundamental human right and as such addresses the state and its bodies; data protection addresses the state¹⁴¹ as well as companies and, depending on the case, even individuals as they may also be controllers or processors.¹⁴²

3.2. Definition of Artificial Intelligence

Big Data is based on algorithms, and algorithms are best described as step-by-step procedures for the calculation, evaluation and automated reasoning as well as decision-making which are based on data

processing.¹⁴³ The difference between Artificial Intelligence and former Big Data analytics is that AI programs do not rely on a linear data analysis; instead they learn from the data which allows them to respond intelligently and to adapt their outputs accordingly.¹⁴⁴ A prominent definition of AI is that Artificial Intelligence is the “activity devoted to making machines intelligent, and intelligence is that quality that enables an entity to function appropriately and with foresight in its environment”¹⁴⁵. John McCarthy who is believed to be the father of AI coined the term Artificial Intelligence as “the science and engineering of making intelligent machines.”¹⁴⁶ Others define AI as a “set of techniques that seek to approximate cognitive tasks” or as “systems that act rationally to achieve goals via perception, planning, reasoning, communicating, decision making and acting.”¹⁴⁷ Other definitions distinguish general and narrow Artificial Intelligence, the latter refers to AI systems “that addresses specific application areas such as playing strategic games, language translation, self-driving vehicles and image recognition”, whereas general AI means “a notional future artificial intelligence system that exhibits apparently intelligent behavior at least as advanced as a person across the range of cognitive, emotional, and social behaviors.”¹⁴⁸ Big Data, Artificial Intelligence and so-called Machine Learning are often used interchangeably, but there are important differences: Big Data is about innovative forms of high-volume, high-velocity and high-variety information processing which is cost-effective and enables enhanced insight and decision making.¹⁴⁹ Artificial Intelligence refers to systems which perceive their environment and which are able to perform various tasks with some degree of autonomy to achieve specific goals.¹⁵⁰ Apart from autonomy, another important characteristic of AI is the adaptiveness of the technology.¹⁵¹ There is no single or generally accepted definition of AI, but the term Artificial Intelligence is used to describe computer systems that are able to learn from own experiences and solve

complex problems in different situations.¹⁵² Scientists speak of AI whenever a non-biological system mimics cognitive functions and this way shows behaviors which were thought to be unique to natural persons.¹⁵³

3.3. Definitions of relevant legal terms

Since (changes to) definitions effect the material scope of the regulation as defined in GDPR Article 2, a series of terms has to be examined.¹⁵⁴ The same applies to eventual restrictions which may apply to special categories of data as well as potential limitations that may be applicable to certain methods of data processing, namely automated individual decision-making and profiling. Many of the core definitions under the Data Protection Directive were not changed,¹⁵⁵ whereas GDPR expanded the scope of some terms¹⁵⁶ and added new definitions, for example for profiling. GDPR covers all of the terms explained in the below definitions. However, privacy and artificial intelligence (AI) are not mentioned, but as they are needed to complete the picture of Big Data, this section will also explain what is meant by privacy and how AI and underlying algorithms shall be interpreted.

3.3.1. Personal data

The Data Protection Directive defined personal data as “any information relating to an identified or identifiable natural person ('data subject'); an identifiable person is one who can be identified, directly or indirectly, in particular by reference to an identification number or to one or more factors specific to his physical, physiological, mental, economic, cultural or social identity”.¹⁵⁷ There was controversial discussion on whether, e.g., IP addresses fall within this definition of personal data.¹⁵⁸ GDPR Article 4 (1) states that, “for the purposes of this regulation, personal data means any information relating to an identified or identifiable natural person (data subject); an identifiable natural person is one who can be identified, directly or indirectly, in particular by reference to an identifier such as a name, an

¹⁵⁸ See the corresponding judgment on IP-addresses by the European Court of Justice in in Case C-582/14, available at <https://eur-lex.europa.eu/legal-content/EN/TXT/HTML/?uri=CELEX:62014CJ0582&from=EL>. Retrieved September 25, 2021.

identification number, location data, an online identifier or to one or more factors specific to the physical, physiological, genetic, mental, economic, cultural or social identity of that natural person”. GDPR thus contains a broad definition of personal data and makes clear that online identifiers and location data are also considered personal data. As a result, GDPR’s material scope is also broader than the scope of the Data Protection Directive.¹⁵⁹ Other laws define personal data differently, e. g. the new California Consumer Privacy Act¹⁶⁰ according to which any information that “identifies, relates to, describes, is capable of being associated with, or could reasonably be linked, directly or indirectly, with a particular consumer or household”¹⁶¹ is considered personal information. Despite obvious similarities, CCPA’s definition of personal information is not identical to GDPR’s definition of personal data, and it’s a good example that terminology can only be the starting point of discussions.¹⁶²

3.3.2. Anonymous data

Unlike pseudonymization,¹⁶³ GDPR does not define anonymization. From a data protection perspective, anonymization of data means processing it with the aim of irreversibly preventing the identification of the individual to whom it relates:¹⁶⁴ data can be considered effectively and sufficiently anonymized if they have been treated in such a manner that the data subject is no longer identifiable.¹⁶⁵ The application of data privacy laws therefore stands and falls with anonymization. Anonymization is moreover valuable from a compliance point of view as it may be considered equal to the deletion of personal data,¹⁶⁶ which is important with regards to data retention and deletion periods. Anonymity is interpreted differently¹⁶⁷ as some refer to so-called computational anonymity, where a data controller (even in collaboration with

¹⁵⁹ The same is true for the territorial scope: the Data Protection Directive only applied to European Union Member States and non-EU members which are a part of the European Economic Area.

¹⁶⁰ The California Consumer Privacy Act (CCPA) was signed into law on June 28 2018, and went into effect on January 1 2020. ¹⁶⁷ Detailed background information is provided by the Article 29 Working Party in their 2014 opinion (05/2014) on anonymization techniques, available at https://ec.europa.eu/justice/article-29/documentation/opinion-recommendation/files/2014/wp216_en.pdf. Retrieved September 25, 2021.

third parties) would have difficulties to directly, or indirectly identify data subjects, while others tend to refer to so-called perfect anonymity where such an endeavor would be impossible. The problem of re-identification is often also described as relative anonymity whose main criterion may be summarized as disproportionality of assignment to a person vs. absolute anonymity whose main criterion may be summarized as the impossibility of assignment to a person.¹⁶⁸ The Data Protection Directive dealt with anonymous data¹⁶⁹ to exclude such data from the scope of data protection legislation, and the same is true for GDPR:¹⁷⁰ Recital 26 (6) is also important for Big Data applications as it makes clear that GDPR “does not concern the processing of (...) anonymous information (...) for statistical or research purposes”. This exception for statistical purposes is tempting to businesses but must be matched against the (rather absolute) definition of personal data as set forth in GDPR Article 4 (1). Furthermore, anonymization of data is anything but easy to achieve,¹⁷¹ many data sets shall therefore rather be classified as pseudonymous data, meaning that it is still possible to single out individuals and / or to link records to them:

3.3.3. Pseudonymous data

GDPR defines pseudonymization as “the processing of personal data in such a manner that the personal data can no longer be attributed to a specific data subject without the use of additional information, provided that such additional information is kept separately and is subject to technical and organizational measures to ensure that the personal data are not attributed to an identified or identifiable natural person”.¹⁷² As a result, personal data which has been subjected to technological measures to make them pseudonymous shall still be considered personal data¹⁷³ as long as information can be attributed¹⁷⁴ to an identifiable person. This definition stresses GDPR’s broad scope, which is a fact many may not welcome in view of the implementation effort, however, there is a variety of advantages for businesses when they process pseudonymous data: pseudonymization is explicitly mentioned¹⁷⁵ as an appropriate technique

¹⁶⁸ An overview on the discussion is provided by Nico Härting: DSGVO – gibt es Regelungen für anonyme Daten? Article published May 3 2016, available at <https://www.cr-online.de/blog/2016/05/03/dsgvo-gibt-es-regelungen-fuer-anonyme-daten/>. Retrieved September 25, 2021.

¹⁶⁹ Recital 26 of Directive 95/46/EC.

¹⁷⁰ GDPR Recital 26.

¹⁷¹ MIT researchers published a study in December 2018 explaining that anonymous data can be re-identified. The corresponding press release is available at <https://www.fastcompany.com/90278465/sorry-your-data-can-still-be-identified-even-its-anonymized>. Retrieved September 25, 2021.

¹⁷² See GDPR Article 4 (5).

¹⁷³ The EU General Court determined in Case T-557/20 that pseudonymized data is not inherently considered personal data. Decision published April 16 2023, available at <https://curia.europa.eu/juris/document/document.jsf?text=&docid=272910&pageIndex=0&doclang=EN&mode=lst&dir=&occ=first&part=1&cid=641166>. Retrieved April 26, 2023.

¹⁷⁴ ICO believes that personal data that has been pseudonymized fall within the scope of the GDPR. depending on how difficult it is to attribute the pseudonym to a particular individual, see ICO’s overview of the General Data Protection Regulation, available at <https://ico.org.uk/for-organisations/data-protection-reform/overview-of-the-gdpr/>. Retrieved September 25, 2021.

¹⁷⁵ See GDPR Article 25: Pseudonymization is mentioned as an example of an appropriate technical measure in correspondence with the principles of data protection by design and data protection by default.

for data controllers to comply with GDPR's data protection principles; restrictions to data subjects' rights apply;¹⁷⁶ breach notification requirements may be impacted.¹⁷⁷ What is particularly interesting for Big Data applications is that profiling on the basis of pseudonymous data may be possible¹⁷⁸ without data subjects' consent as processing of such data is unlikely to significantly affect individuals, which is one of the admissibility criteria under GDPR Article 22 (1). As a result, it can be assumed that the GDPR shows strong incentives to employ data pseudonymization technologies.

3.3.4. Special categories of data

GDPR does not address or define all types of personal data that would generally be considered sensitive or worthy of protection. GDPR covers and defines special categories of data such as genetic,¹⁷⁹ biometric¹⁸⁰ or health¹⁸¹ data and states that, as a basic rule, sensitive personal data must not be processed.¹⁸² In comparison to the Data Protection Directive, the protection of genetic and biometric data is new. As a result, GDPR has a broader definition of so-called sensitive personal data. Moreover, GDPR Article 22 (4) prohibits automated individual decision-making including profiling if it is based on special categories of personal data referred to in GDPR Article 9 (1), so that numerous categories of data¹⁸³ are generally not suitable for this type of data processing. If pseudonymous data is a good example for the possibility to conduct Big Data analyses, sensitive data may serve as an example for restrictions in this area.¹⁸⁴ But there are exceptions to this rule as GDPR Article 22 (4) also says that automated individual decision-making including profiling is admissible if it is based on explicit consent or if it is necessary for reasons of substantial public interest.¹⁸⁵

3.3.5. Processing

GDPR defines processing as “any operation or set of operations which is performed on personal data or on sets of personal data, whether or not by automated means, such as collection, recording, organization, structuring, storage, adaptation or alteration, retrieval, consultation, use, disclosure by transmission,

¹⁷⁶ GDPR Article 11 (2) affects individuals' rights of access, the right to correct and erase data as well as requests for data portability.

¹⁷⁷ See GDPR Article 34 (3a) .

¹⁷⁸ Subject to a successful assessment of legitimate interests, GDPR Article 4 (1) lit. f.

¹⁷⁹ See GDPR Article 4 (13) and Recital 34.

¹⁸⁰ See GDPR Article 4 (14), for instance, fingerprints, facial recognition, etc.

¹⁸¹ See GDPR Article 4 (15) and Recital 35.

¹⁸² Unless there is a justification, for example individuals' explicit consent: GDPR Article 9 (2a).

¹⁸³ Racial or ethnic origin; political opinions; religious or philosophical beliefs; trade union membership; genetic data; data concerning health; data concerning a natural person's sex life or sexual orientation; biometric data for the purpose of uniquely identifying a natural person: GDPR Article 9 (1).

¹⁸⁴ Moreover, large scale processing of sensitive personal data triggers the need to undertake data protection impact assessments, see GDPR Article 35.

¹⁸⁵ In addition, suitable measures to safeguard the data subject's rights and freedoms and legitimate interests must be in place.

dissemination or otherwise making available, alignment or combination, restriction, erasure or destruction”.¹⁸⁶ If even erasure and deletion of personal data is considered as a data processing activity under the GDPR, these related data processing activities in the life cycle of personal information raise the question of the appropriate legal basis, which underlines that GDPR is about finding the right legal basis: just like the Data Protection Directive, GDPR works with prohibitions that are subject to permission, and the processing of special categories of data is a perfect example in this regard. The definition of processing is also very broad and makes it clear that the applicability of GDPR is not limited to so-called automated processing as handwritten records may also fall under GDPR. While any use of computers, smartphones, cameras, scanners or Internet and e-mail can lead to the applicability of the GDPR if personal data are concerned, non-automated processing of personal data is only covered by the scope of application if the data are (or are to be) stored in a filing system as defined in GDPR Article 4 (6).¹⁸⁷

3.3.6. Profiling

The Data Protection Directive did not contain a definition of profiling; the GDPR introduced a new definition of profiling: “any form of automated processing of personal data consisting of the use of personal data to evaluate certain personal aspects relating to a natural person, in particular to analyze or predict aspects concerning that natural person’s performance at work, economic situation, health, personal preferences, interests, reliability, behavior, location or movements”.¹⁸⁸ Profiling means massive processing of personal data in order to identify patterns that allow for the automatic categorization of individuals and aims at predictive data mining.¹⁸⁹ Profiling moves away from the use of personal data as we know it, because, instead of collecting personally identifiable data, a digital persona is created which is based on information algorithms created with the help of attributes which are not directly related to individuals.¹⁹⁰ While the probabilistic nature of profiles is desired, their inherent opacity¹⁹¹

¹⁸⁶ See GDPR Article 4 (2).

¹⁸⁷ Filing system means any structured set of personal data which are accessible according to specific criteria, whether centralized, decentralized or dispersed on a functional or geographical basis.

¹⁸⁸ See GDPR Article 4 (4).

¹⁸⁹ Gloria Gonzalez Fuster, Serge Gutwirth, Eriak Ellyne: Profiling in the European Union – a high-risk practice, Inex Policy Brief no. 10, published June 2010, available at <https://www.ceps.eu/system/files/book/2010/06/INEX%20PB10%20Fuster%20et%20al.%20on%20Profiling%20in%20the%20EU%20e-version.pdf>. ¹⁹¹ Tal Zarsky: The Trouble with algorithmic decisions: An analytic roadmap to examine efficiency and fairness in automated and opaque decision making. Article published October 14 2015, available at <https://journals.sagepub.com/doi/abs/10.1177/0162243915605575>. Retrieved September 25, 2021.

together with their potential for discrimination¹⁹² is considered problematic.¹⁹³ An important legal development in this regard is that many countries are coming up with privacy laws of their own¹⁹⁴ and these laws foresee, amongst other things, rules on automated decision making and profiling which are similar to the ones set forth in the GDPR.¹⁹⁵

3.3.7. Automated decision-making

Even though GDPR combines both topics in the same Article, profiling and automated individual decision-making must be distinguished: Profiling is based on automated processing with the objective to evaluate personal aspects about a natural person, however, only automated decision-making has the ability to make decisions by technological means without human involvement. GDPR stipulates that “the data subject shall have the right not to be subject to a decision based solely on automated processing, including profiling, which produces legal effects concerning him or her or similarly significantly affects him or her”.¹⁹⁶ Automated decision-making presupposes that there is no human intervention¹⁹⁷ at all, so that mere pre-selection processes (decision support systems) do not fall under the rule.¹⁹⁸ The problem is where to draw the line between (generally admissible) pre-selection and (potentially inadmissible) decision-making: the question is which (interim) results¹⁹⁹ can be considered to have the quality of a decision in the sense of the Regulation, i.e. a decision “which produces legal effects concerning him or her or similarly significantly affects him or her”. There is consensus that this question can only be answered on a case-by-case-basis since all circumstances have to be considered, but there are dissenting opinions²⁰⁰ as to whether or not marketing activities similarly significantly affect data subjects.²⁰¹

¹⁹² This problem was reviewed by the Article 29 Working Party in their 2017 guidelines on automated individual decision-making and profiling for the purposes of Regulation 2016/679, published August 22 2018, available at https://ec.europa.eu/newsroom/article29/item-detail.cfm?item_id=612053. ¹⁹⁸ Stephan Dreyer, Wolfgang Schulz: Was bringt die Datenschutzgrundverordnung für automatisierte Entscheidungssysteme? Bertelsmann Stiftung Publishing 2018, p. 19.

¹⁹⁹ Any such decision must be the result of automated processing: Spiros Simitis: Bundesdatenschutzgesetz 2006, para. 6 a BDSG, note 26.

²⁰⁰ Some believe that the economic and practical significance of the decision play a role as well as the sustainability of the impairment, whereas annoying or uncomfortable consequences of an automated decision should not be regarded as a significant impairment: Stephan Dreyer, Wolfgang Schulz: Was bringt die Datenschutzgrundverordnung für automatisierte Entscheidungssysteme? Bertelsmann Publishing 2018, p. 20.

²⁰¹ According to the Commission, sending out advertising material does not have a significant adverse effect on data subjects. However, it should not be overlooked that this view dates to 1992, a time when it was not at all foreseeable what the extent of targeted advertising would be like some years ago: Spiros Simitis: Bundesdatenschutzgesetz 2006, para. 6 a, note 24.

Recital²⁰² 71 names two typical examples of automated individual decision-making: e-recruitment processes and (refusal) of an online credit application, which shows that automated individual decision-making is relevant whenever dynamic (real-time) results are needed.²⁰³ In addition, there are several exceptions²⁰⁴ to the above rule that individuals have the right not to be subject to a decision based solely on automated processing, e.g., if such processing is based on data subjects' explicit consent, or if the processing is necessary for entering into or performance of a contract between the data subject and a data controller, or if it is allowed by Union or member state law to which the controller is subject.²⁰⁵ Each of these exceptions is problematic, for the following reasons: consent seems problematic due to factors like lack of transparency and / or information asymmetries and imbalance of powers. As regards the necessity of processing for entering into or performance of a contract between the data subject and a data controller, the problem is that the exception actually applies to scenario which Recital 71 considers a typical use case of the norm, namely credit applications.²⁰⁶ The permissibility of national rules²⁰⁷ dilutes GDPR's overall goal to harmonize the legal framework, it increases legal uncertainties caused by the necessary interpretation of national laws in the light of higher-ranking EU law, and it makes compliance more difficult for those controllers who do not merely fall under one jurisdiction. At first sight, the Regulation also foresees for a limit for the admissibility of automated decision-making as GDPR Article 22 (4) prohibits the use of special categories of personal data within the meaning of GDPR Article 9 (1) for automated decision-making. But this does not apply if the data subject has given explicit consent or when processing is necessary for reasons of substantial public interest.²⁰⁸ GDPR Article 9 (2) names a whole catalogue of exemption clauses, and from an entrepreneurial point of view, it is likely that the following two exceptions will arouse interest: processing of sensitive data is admissible if it relates to personal data which are manifestly made public by the data subject,²⁰⁹ and processing of special categories of data is admissible if it is "necessary for archiving purposes in the public interest, scientific or historical research purposes or statistical purposes in accordance with Article 89 (1) based on Union or Member State law which shall be proportionate to the aim pursued (and) respect the essence

²⁰² Unless otherwise specified, Recital always refers to GDPR Recitals.

²⁰³ For instance in the area of differential pricing, which is considered a significant effect if prohibitively high prices effectively bar someone from certain goods or services: Article 29 Working Party in their 2017 guidelines on automated individual decision-making and profiling for the purposes of Regulation 2016/679, available at https://ec.europa.eu/newsroom/article29/item-detail.cfm?item_id=612053. Retrieved September 25, 2021.

²⁰⁴ All of them are, according to Recital 71 "subject to suitable safeguards, which should include specific information to the data subject and the right to obtain human intervention, to express his or her point of view, to obtain an explanation of the decision reached after such assessment and to challenge the decision."

²⁰⁵ Provided that such a law also lays down suitable measures to safeguard the data subject's rights and freedoms and legitimate interests, see GDPR Article 22 (2b).

²⁰⁶ Stephan Dreyer, Wolfgang Schulz: Was bringt die Datenschutzgrundverordnung für automatisierte Entscheidungssysteme? Bertelsmann Stiftung Publishing 2018, p. 21.

²⁰⁷ For example, the new German BDSG provides a corresponding exception for insurance contracts in § 37 (1).

²⁰⁸ Datenschutzkonferenz Kurzpapier Nr. 17, pp. 2 and 3. Paper published March 27 2018, available at https://www.datenschutzzentrum.de/uploads/dsgvo/kurzpapiere/DSK_KPNr_17_Besondere-Kategorien.pdf. Retrieved September 25, 2021.

²⁰⁹ See GDPR Article 9 (2) lit. e.

of the right to data protection”.²¹⁰ It can therefore be assumed that companies may concentrate on the investigation of and focus on scientific and statistical purposes in connection with Big Data applications and automated decision-making. In any event, in order to perform automated decision-making in a compliant manner, the controller has to implement suitable measures²¹¹ to safeguard data subjects’ rights and freedoms and interests and to assess and document²¹² the endeavor. Finally, it should be noted that with regard to GDPR Article 22, there is controversy about the ambiguity of the norm, as to whether or not the rule shall be interpreted as a prohibition²¹³ in the sense that the controller must respect legal limitations, or if it shall be considered an individual right.²¹⁴ The difference being that, exercising a right requires action of the data subject, while a prohibition offers protection by default. The latter seems favorable and is supported by the EDPB,²¹⁵ because otherwise, automated decisions could perhaps be legitimized based on implicit consent, which does not comply with the idea of consent as a specific, freely given and informed indication of a data subject’s choices.²¹⁶ Therefore, the concept of consent must be examined as well:

3.3.8. Consent

Consent generally plays an important role in data protection and is frequently used to justify the processing of personal data.²¹⁷ Recital 32 describes conditions for consent as set forth in GDPR Article 7: “Consent should be given by a clear affirmative act establishing a freely given, specific, informed and unambiguous indication of the data subject’s agreement to the processing of personal data relating to him or her, such as by a written statement, including by electronic means, or an oral statement”. Consequently, Recital 32 explains that inactivity cannot constitute consent; consent can only be given unambiguously. Like the Data Protection Directive, GDPR requires explicit consent for sensitive

Report published May 17 2022, available at <https://fpf.org/blog/fpf-report-automated-decision-making-under-the-gdpr-a-comprehensive-case-law-analysis/>. Retrieved December 29, 2022.

²¹⁶ Even though the authors refer to the Data Protection Directive and not to GDPR, their argument is still valid: Servge Gutwirth, Paul De Hert: Regulating profiling in a democratic constitutional state, in: Profiling the European citizen, Springer Publishing 2010, p. 283, available at http://www.vub.ac.be/LSTS/pub/Dehert/Dehert_365_restricted.pdf. Retrieved September 26, 2021.

²¹⁷ In May 2020, the EDPB adopted Guidelines 05/2020 on consent under Regulation 2016/679. The guidelines are available at https://edpb.europa.eu/our-work-tools/documents/public-consultations/2022/guidelines-012022-data-subject-rights-right_en.

personal data,²¹⁸ and consent can generally be distinguished by differentiating between explicit and implicit as well as written versus orally given consent²¹⁹. GDPR also brought some changes with regards to consent, beginning with seemingly simple topics like form requirements: GDPR does not insist on a written form requirement; the contrary is true, but Recital 42 makes it clear that there is a burden of proof that consent exists, and that is why controllers have to think about how to best comply with the challenge of demonstrating that the data subject has given consent to the processing operation. The issue of form requirements also led to sector- and scenario-specific variations in national jurisdictions:²²⁰ For example,²²¹ former § 4a (1) of the German Federal Data Protection Law as a general rule required written form for consent. However, § 13 (2) of the German Tele-Media Act²²² allowed for electronic consent, for example, by clicking a checkbox. In addition, § 26 (2) of the new German Federal Data Protection Law again stipulates the written form in an employment context. Another particularity is that GDPR introduced special conditions applicable to child's consent in relation to information society services.²²³ Consent may be an important legal basis when it comes to marketing activities, unless so-called soft opt-in rules apply. The GDPR does not have specific provisions that address marketing activities, but Recital 47 deals with marketing by explaining that “the processing of personal data for direct marketing purposes may be regarded as carried out for a legitimate interest”. GDPR is furthermore not silent on various topics that are highly relevant for Big Data, ADM, and AI, e.g., automated decision-making and profiling,²²⁴ admissible re-use of personal information,²²⁵ international data transfers,²²⁶ transparency,²²⁷ data subject rights,²²⁸ data security²²⁹ or requirements that apply to special categories of personal information²³⁰ - all of which might play a role in the context of valid consent as the basis of admissible data processing. Consent is key when the exercise of control over own data is in question, and an

²¹⁸ Explicit consent is needed for the processing of special categories of personal data, see GDPR Article 9 (2 a).

²¹⁹ However, providing proof or such consent might be challenging, see GDPR Article 7 (1): “the controller shall be able to demonstrate that the data subject has consented to processing of his or her personal data.”

²²⁰ In comparison (and as a rule), former § 4 a (1) of the German Federal Data Protection Law required written form for consent (with exceptions depending on the circumstances of the individual case). However, § 13 (2) of the German Tele-Media Act allowed for electronic consent, e.g., by clicking a checkbox and the like.

²²¹ With exceptions depending on the circumstances of the individual case. It is questionable how a deviation from the written form requirement could be argued in the employment environment when in fact employees are either permanently present or can be reached via Intranet, Email, by post. If time pressure was to serve as an argument, this fails due to fact that this way, the voluntary nature of consent is in doubt.

²²² The German Telemedia Act (TMG) will soon to be replaced with the “Telecommunications Telemedia Data Protection Act” (TTDSG). This new law is intended to bundle the parts of the German Telecommunications Act (TKG) and the German Telemedia Act (TMG) that are relevant to data privacy into one central law. Background information on this legal development is provided by the consultancy bITs in their blog “TTDSG passiert Bundesrat – endlich verbindliche Regelungen für Cookies“ published June 3 2021, available at <https://www.bits.gmbh/ttdsg-passiert-bundesrat-endlich-verbindliche-regelungen-fuer-cookies/>. Retrieved September 26, 2021.

important condition to exercise control is transparency.²³¹ That is why a data subject requires all necessary information to make a free decision, and this seems difficult when automated decision-making is applied. Consequently, one of the major issues regarding consent in the framework of automated decision-making, especially when it is based on profiling, is the question whether sufficient information was provided to the data subject: Given the complex matter, even if the data controller fulfills existing transparency requirements and provides the data subject with information concerning the logic involved in making the decision, it remains questionable whether the fulfillment of this legal obligation is enough for the data subject to realize how an automated decision may (and will) affect him.²³² It is difficult to imagine valid consent as consent must be intelligible in order to be specific; clear reference has to be made to the scope and the consequences of the data processing.²³³ From a business perspective it must be considered that, for reasons of intellectual property and competitive advantage, functionality and logic of an algorithm are often kept secret and therefore not or only partially disclosed.²³⁴ Moreover, Recital 43 explicitly stresses that “in order to ensure that consent is freely given, consent should not provide a valid legal ground for the processing of personal data in a specific case where there is a clear imbalance between the data subject and the controller”. This is most probably the case for all Big Tech players such as Meta (formerly known as Facebook)²³⁵ or Google. Recital 43 also underlines that consent is presumed not to be freely given if the performance of a contract or the provision of a service is made conditional on the consent of the data subject to the processing of personal data. Another factual problem arises from the fact that automated decision-making which is based on profiling does not have to cover exclusively the personal data of the data subject that consented to this type of data processing, but that it might also involve personal data of other individuals.²³⁶ Consent can neither cover other people’s personal data nor can it be applied in an open-ended set of processing activities. Furthermore, consent can be revoked at any time, and in the framework of automated individual decision-making, additional data subject rights apply.²³⁷ As a result, using consent as legal grounds for data processing is sometimes

²³¹ Detailed background information is provided by the Article 29 Working Party in their opinion on consent. Paper (15/2011) published July 13 2011, available at https://ec.europa.eu/justice/article-29/documentation/opinion-recommendation/files/2011/wp187_en.pdf. Retrieved September 26, 2021.

²³⁷ The data subject has the right to contest the decision, to express his or her point of view and to obtain human intervention on the part of the controller, see Laurens Nauds: The right not to be subject to automated decision-making: the role of explicit consent. Article published August 2 2016, available at

much more difficult and much less recommendable than many businesses might assume. However, many companies still opt for consent²³⁸ as they believe this is both, a legally admissible and safe way to obtain legal grounds for the desired data processing.

3.3.9. Other relevant terms including risk and harm

Apart from the above definitions, GDPRs furthermore defines other important terms such as controller, processor, recipient and third party. These terms are important for assigning responsibility: a controller is a natural or legal person (...) which, alone or jointly with others, determines the purposes and means of the processing of the personal data.²³⁹ A processor is a natural or legal person (...) which processes personal data on behalf of the controller.²⁴⁰ A third party is a natural or legal person (...) other than the data subject, controller, processor or persons who, under the direct authority of the controller or processor are authorized to process personal data.²⁴¹ A recipient, on the other hand, is a natural or legal person to which the personal data are disclosed.²⁴² Joint controllership is given when two or more controllers jointly determine the purposes and means of the processing.²⁴³ Given the complexity of modern data processing activities and the variety of service providers involved, the differentiation needed to identify and distinguish these players is not always easy to accomplish. Due to the fact that Big Data, automated decision making and Artificial Intelligence may involve risk from a data subject perspective, it is important to know what GDPR says about risk: Recital 75 deals with risks to the rights and freedoms of natural persons and explains that “the risk to the rights and freedoms of natural persons, of varying likelihood and severity, may result from personal data processing which could lead to physical, material or non-material damage, in particular: where the processing may give rise to discrimination, identity theft or fraud, financial loss, damage to the reputation, loss of confidentiality of personal data protected by professional secrecy, unauthorized reversal of pseudonymization, or any other significant economic or social disadvantage; where data subjects might be deprived of their rights and freedoms or prevented from exercising control over their personal data; where personal data are processed which reveal racial or ethnic origin, political opinions, religion or philosophical beliefs, trade union membership, and the processing of genetic data, data concerning health or data concerning sex life or criminal convictions and offences or related security measures; where personal aspects are evaluated, in particular analyzing or predicting aspects concerning performance at work, economic

²⁴³ See GDPR Article 26 (1).

situation, health, personal preferences or interests, reliability or behavior, location or movements, in order to create or use personal profiles; where personal data of vulnerable natural persons, in particular of children, are processed; or where processing involves a large amount of personal data and affects a large number of data subjects.” GDPR as such does not define risk, it only provides interpretative guidance on what may constitute risk and lists examples, and the fact that privacy violations may be given without privacy harms²⁴⁴ and the fact that relevant terms like risk, threat, harm, injury or violation are often used interchangeably or evaluated in a different context (e.g., regulator perspective as opposed to the individual’s or court perspective) adds to the problem. Regulators dealt with the issue of informational injuries²⁴⁵ and various scholars tried to explain risk and provide a typology of privacy harms,²⁴⁶ e.g., by distinguishing privacy harms as follows: physical, economic, reputational, emotional; due to disturbance, vulnerability, loss of autonomy, control, informed choice or based on thwarted expectations, chilling effects, or discrimination. Another approach was to explain which risks exist in which stages of data processing,²⁴⁷ starting with information collection: surveillance (e.g., monitoring) and interrogation (e.g., questioning) and during data processing: aggregation (e.g., combining of datasets), identification (e.g., linking of information), secondary use (e.g., using data for other purposes), insecurity (e.g., carelessness in protecting information from leaks), exclusion (e.g., failure to let the individual know about information others have about them) and in the event of information dissemination, where the following risks have been identified: breach of confidentiality (e.g., breaking the promise to keep information confidential), disclosure (e.g., revealing truthful information), distortion (e.g., disseminating false or misleading information about an individual), blackmail (e.g., threatening to disclose information), increased accessibility (e.g., amplifying the accessibility of personal information) and appropriation (e.g., using an individual’s identity to serve the aims and interests of another), and finally invasion where intrusion (e.g., disturbing an individual’s tranquility) can be distinguished from decisional interference (e.g., interfering with an individual’s decision making). One further aspect to consider is that Big Data, ADM and AI do not only involve potential risks for individuals but may also lead to societal harms,²⁴⁸ e.g., by accelerating growth and prosperity for some, and at the same time leading to significant changes in the employment sector for others or by leading to greater connectivity on the one hand but also greater vulnerability on the other owing to a much larger “cyber-physical attack

surface.”²⁴⁹ Risk generally depends on the context, the operational environment as well as the type of data, the device in question as well as access and data location, retention and preservation.²⁵⁰ In addition, risk may also be based on (weak) business processes and governance, miscommunication and conflict of interest as well as resource and project management, and issues of stewardship, values and ethics.²⁵¹ Finally, Big Data and AI applications also have a political dimension and human rights implication.²⁵² One definition of risk the privacy community came up with is that “privacy risk equals the probability that a data processing activity will result in an impact, threat to or loss of (in varying degrees of severity) a valued outcome (for example rights and freedoms).”²⁵³ GDPR takes a risk-based approach, for example by saying that technical and organizational measures must match the processing with regards to “the nature, scope, context and purposes of processing as well as the risk of varying likelihood and severity for the rights and freedoms of natural persons,”²⁵⁴ and GDPR also deals with high risk since impact assessments are needed for high risk data processing activities.²⁵⁵ However, it is difficult to draw the line between (i.e. low) risk and high (or unacceptable) risk, but the fact that many European supervisory authorities issued guidance in accordance with GDPR Article 35 (4) and provided “list(s) about which (...) processing operations (...) are subject to the requirement for a data protection impact assessment” helps in practice when it comes to defining and documenting high-risk processing activities based on general criteria such as large-scale processing, systematic monitoring, or the use of new technology.²⁵⁶

3.3.10. Challenges with definitions and terminology

Risk is a good example of challenges as regards definitions and terminology since these seemingly simple questions raise issues in relation to scope and applicability: the notion of risk is a key element when it comes to assessing potential consequences of data processing activities. While it is clear that risk can be manifold, GDPR’s comprehensive protective purpose which is laid down in the above-

²⁵⁵ See GDPR Article 35.

²⁵⁶ GDPR Recital 91 provides background on the “necessity of a data protection impact assessment”.

mentioned detailed catalogue of examples for potential risks is viewed critically for many reasons: some say that “no life risk of this world remains unmentioned in Recital 75”²⁵⁷ and that this ultimately leads to the question where data protection ends. This is all the more true given the fact that more and more data qualify as personal information, because combining of data sets and the like may lead to linkability of information and identifiability of natural persons, meaning that literally any handling of data would become subject to data protection laws.²⁵⁸ Others stress that data protection law, unlike other areas of law, does not dispose of limiting, restrictive criteria to help balance rights and freedoms and interest²⁵⁹ and this way, allow for legal certainty. Most importantly, GDPR uses a variety of terms, and it is questionable if that means that those terms can be used interchangeably. It also leads to the question which concept is behind that terminology in the sense of what exactly is to be protected by GDPR: rights, freedoms, interests, privacy, data protection, informational self-determination, informational integrity or a combination?²⁶⁰ GDPR mentions rights and freedoms fifty times, and fundamental rights and freedoms around a dozen times, whereas other terms like vital or legitimate interests, human dignity or compelling legitimate grounds are used in specific scenarios. The list of protected interests seems erratic, and it appears that literature has not yet taken the time to examine GDPR’s wording to define protected interest.

This chapter focused on the GDPR owing to its scope²⁶¹ and illustrated that the GDPR defines and thus governs the use of personal, pseudonymous as well as special categories of data. The GDPR also defines data processing, automated decision-making, and profiling as well as consent, and deals with further relevant terms including risk. However, when it comes to definitions and terminology, there are numerous challenges, be it interpretation or translation issues or the fact that GDPR uses certain terms without providing definitions, for example, freedoms and interests. A core issue that seems truly difficult to resolve is the definition and relationship between data protection and data privacy, which are terms that are often used interchangeably, even though they are not the same. In addition, further legal

initiatives around the globe add new terminology and definitions²⁶² which result in further complexity and uncertainty.

4. Characteristics, types, benefits and risks of Big Data and AI

Rather than discussing various definitions, this chapter describes Big Data and Artificial Intelligence by explaining their characteristics and the most relevant Data and Artificial Intelligence types and use cases, including their benefits to provide an overview over the impressive capabilities of these novel technologies. On the one hand, real-time analytics and the like are truly valuable from a business perspective, on the other hand, Big Data and AI may involve serious risks, and that is why this chapter explains in detail the challenges that may be involved when this technology is used, for example, data aggregation, secondary use of data, opaqueness, information mismatch, loss of human oversight as well as liability and security issues. AI's potential for discrimination, surveillance, intrusion, or manipulation, its potential impact on privacy self-management show how important it is to investigate these effects and match to them against the present and proposed or recommended future legal framework.

4.1. Characteristics of Big Data

There are numerous definitions of Big Data, but rather than searching for the perfect definition, it makes more sense to turn to the characteristics of Big Data and to understand the value chains:²⁶³ It can generally be said that Big Data is about the analysis²⁶⁴ of vast amounts of data at high speed (ideal: 'real-time') with the aim of making it economically viable. The reason for that is that, in today's business landscape, data management can be a major determinant of success. Big data applications are characterized by large and growing amounts of data (e.g. sensor, log, clickstream, transaction or location data, search queries, social network interactions), data diversity (types, sources, formats), the speed of the evaluation (ideal: real time) and the quality of the results and forecasts obtained out.²⁶⁵ Big Data lives on a large, diverse, complex and growing and pool²⁶⁶ which can only be addressed with new (corresponding) techniques and a suitable infrastructure to cope with such datasets. Big Data is therefore different from old school data management, particularly because nowadays, the performance of

²⁶² For example, consent is defined differently in various jurisdictions, see Securiti's Q1 2023 publication: State of global consent requirements, available at <https://securiti.ai/whitepapers/cookie-consent-global-heat-map/>. Retrieved March 10, 2023.

computational tasks place in an affordable and convenient way as processing of data is much cheaper and sharing of data is much easier.²⁶⁷ It became popular to characterize Big Data by volume, variety and velocity,²⁶⁸ terms which are all commencing with the initial letter “V”, and ever since, the number of terms grew from the initial three “Vs” to more than forty.²⁶⁹ However, only the most common vectors shall be presented in the framework of this paper:

Volume – size of data: The volume of data is increasing at a staggering rate²⁷⁰ as more people use data-collecting devices and more devices are connected to the Internet, which results in the generation of billions of terabytes of (man-human, man-machine, and machine-machine) data per day.

Variety – type of data: Databases were designed to process a smaller volume of structured data, and the challenge with Big Data is that it includes various sources and formats of (un-)structured data, audio, video, social media information,²⁷¹ and that the level of completeness differs.

Velocity – speed of data: Not only the volume of data is increasing, but also the rate at which data is generated.²⁷² The rapidly increasing speed at which new data is being created²⁷³ also affects the need for that data to be digested and analyzed in near real-time.

Veracity – quality of data: Veracity is about how truthful a data set may be. It has to do with improving the accuracy of Big Data by removing undesired factors like duplication, inconsistencies, abnormalities or bias. It is therefore very important²⁷⁴ from a decision and intelligence viewpoint.

²⁷³ For instance, in the framework of online gaming where millions of users operate concurrently or the large amount of photo material which is uploaded daily to social media platforms, or stock exchange operations where trading movements are reflected within microseconds, etc.

²⁷⁴ Cassandra McNeill: Veracity – the most important “V” of Big Data. Article published August 29 2019, available at <https://www.gutcheckit.com/blog/veracity-big-data-v/>. Retrieved September 26, 2021.

Variability – meaning of data: Variability is different from variety as variability focuses on properly understanding and interpreting the correct meanings of raw data. This is particularly important in the framework of natural language processing.²⁷⁵

Volatility – duration of usefulness of data: Volatility refers to how long data is available, how long it is valid and how long it should be stored.²⁷⁶ In a world of real-time data, the point at which data is no longer relevant to the current analysis has to be determined.²⁷⁷

Value – importance of data: Big Data is about turning volume to value, other characteristics seem rather meaningless if businesses cannot derive economic value and competitive advantage²⁷⁸ from Big Data. Value is the return resulting from data management by using Big Data and AI: it is predicted that only China will make US\$600 billion annually with the help of AI and machine learning technology.²⁷⁹

The above characteristics do not represent an exhaustive description of Big Data applications. To complete the above enumeration to a certain extent, below is an overview of the most used features in large data applications:²⁸⁰

Volume	Quantity of collected and stored data
Velocity	The transfer rate of data between source and destination
Value	Business value to be derived from Big Data
Variety	Different type of data (pictures, videos, audio) are returned
Variability	Differentiation between noisy data and important data
Veracity	Analysis of captured data is virtually worthless if it's not accurate

²⁷⁵ For example, the word “great” is associated with something positive whereas “greatly” (disappointed) has a negative meaning, see Eileen McNulty: Understanding Big Data - the Seven V's, the article was published on May 22 2014 and is available at <https://dataconomy.com/2014/05/seven-vs-big-data/>. Retrieved July 25 2022.

²⁸⁰ The overview is based on an article by Arockia Panimalar, Varnekha Shree and Veneshia Kathrine who describe the evolution of the vectors in their article: The 17 V's of Big Data, International Research Journal of Engineering and Technology 2017, vol. 4, issue 9, pp. 329-333, available at <https://www.irjet.net/archives/V4/i9/IRJET-V4I957.pdf>. Retrieved September 26, 2021.

Validity	Accuracy of data used to extract result in the form of information
Volatility	Question of how long the stored data is useful for the user
Virality	Rate at which the data is spread and received by different users
Viscosity	Time difference when the event occurred and when it was described
Vagueness	Ambiguity about data found; interpretation issues with results found

Even though it is still very common to link Big Data and AI to large volumes of data, some scientists believe that the future of Artificial Intelligence will be about less data, not more:²⁸¹ they claim that the training on mountains of data will soon be replaced since such systems have serious limitations, for example in cases in which little data exists or in instances where computers can be easily stumped.²⁸² They believe that companies will rely less on bottom-up data and more on top-down reasoning which resembles the way humans approach problems and tasks, e.g., by using common sense and ready expertise.

4.2. Types of Big Data analytics

As regards Big Data analytics, a general distinction can be made between three dominant types of analytics, each of them offering different findings: descriptive, predictive and prescriptive analytics.²⁸³ Descriptive analytics use data aggregation and data mining to create reports, dashboards or scorecards in order to provide insight into the past. Predictive analytics use statistical models and forecasts techniques to discover explanatory patterns, and that is why such tools can predict an outcome with a significant probability of accuracy and provide businesses the ability to forecast future developments. Prescriptive analytics use optimization and simulation algorithms to provide advice on possible outcomes. The possibilities to make use of Big Data applications are countless, however, Big Data applications can roughly be divided in the following groups:²⁸⁴ customer analytics, operational analytics, analytics which are used to (further) develop data-driven products and services as well as tools which are used for compliance purposes and fraud detection. These objectives are often grouped in a different

²⁸¹ James Wilson, Paul Daugherty, Chase Davenport: The future of AI will be about less data, not more. Article published January 14 2019, available at <https://hbr.org/2019/01/the-future-of-ai-will-be-about-less-data-not-more>. Retrieved September 26, 2021.

²⁸² At present, smart phone facial recognition systems are sometimes unable to recognize “morning faces”, i.e., a puffy, haggard look on first awakening; autonomous driving is tricky as such cars have difficulties to recognize children or pedestrians wearing costumes; so-called CAPTCHAs are easy for humans, but hard for computers.

²⁸³ Explanations and definitions of these terms can be found in James Blackman’s 2018 article: Operational intelligence, three ways – descriptive, predictive and prescriptive. Article published December 11 2018, available at <https://enterpriseiotinsights.com/20181211/channels/fundamentals/descriptive-predictive-prescriptive-analytics>. Retrieved September 26, 2021.

²⁸⁴ A summary on Big Data use cases is provided by Datameer in their 2016 E-book: Top five high-impact use cases for Big Data Analytics. E-book published 2016, available at <http://orcp.hustoj.com/wp-content/uploads/2016/01/eBook-Top-Five-High-Impact-UseCases-for-Big-Data-Analytics.pdf>. Retrieved September 26, 2021.

manner, depending on whether or not transactional data are in question, such as: decision science to improve the decision-making process; performance management which is typically done by business intelligence tools using dashboards, reports; data exploration which makes use of statistics to allow for predictive modeling as well as (social) analytics to measure awareness, engagement and word of mouth, the success of (online) campaigns, etc.²⁸⁵

4.2.1. Operational analytics and forecasting

Operational analytics refers to business analytics which focus on improving existing operations and to get more transparent information for business planning purposes.²⁸⁶ As such, the idea of improving of business operations is anything but new. The difference nowadays is that Big Data allows for a more detailed and timely insight into operations, which is important for monitoring and maintenance of systems or supply chain management etc. A higher level of operational analytics can be achieved when so-called data warehouse optimization is used: A data warehouse²⁸⁷ is a data-service platform, a repository for all data an enterprise holds in various operational systems with the aim to capture data from diverse sources to allow for access and analysis rather than for transaction processing. The advantage²⁸⁸ of such a unified database is that it allows for a unified approach for organizing and representing data; that is has a robust infrastructure; ideally with a high level of security and scalability; that it is accessible across the company for all divisions and that it enables contingency plans in terms of business continuity.

4.2.2. Customer analytics and marketing

There is a myriad of uses cases when customer analytics are in question: the segmentation of customers based on behavior patterns, the creation of 360-degree customer views, the analysis of customer sentiments, the delivery of personalized customer services based on customer profiles in real time, e.g., by so-called robo-advisor services or chat-bots,²⁸⁹ the recommendation of next-best products to buy or

²⁸⁹ Examples provided by Karsten Egetoft: Data-driven analytics: practical use cases for financial services. Article published January 29 2019, available at <https://www.digitalistmag.com/customer->

the prevention of customer churn,²⁹⁰ The prevention of customer churn is good example of how Big Data analytics are used as a basis for follow-up measures: an organization conducts a data analysis and identifies potentially critical moments in the customer relationship, for example by analyzing the ratio between the term and the amount of a loan in relation to the time at which loans were repaid in advance. The analysis is the first step for the creation of an efficient marketing mix as only those customers will be contacted where data indicated that there is a risk of early repayment, resulting in financial loss for the bank. As far as data protection is concerned, the first step may well work with aggregated data without the need to process personal data, but the second step is legally much more demanding as customer contacts are covered not only by data protection, but also by competition law.²⁹¹ Another important use case is social media – from advertising to speech and content moderation.

4.2.3. Data-driven products and services

A prominent example of analytics which are used for data-driven products and services is pricing. Average Internet users are not aware that neither the content²⁹² which a website displays nor the prices it indicates are the same to every user. Online shops are technically capable to offer each website customer a different price, a practice called personalized pricing.²⁹³ customers can be recognized with the help of so-called cookies²⁹⁴ which can categorize customers in order to group them as an either price-sensitive or a price-insensitive person. It can be argued that European data protection law applies to personalized pricing, meaning that companies are required to inform people about the specific purpose of processing their personal data.²⁹⁵ The lawfulness of price personalization under the GDPR on the basis of consent, the necessity for pre-contractual or contractual measures, and the data controller's

²⁹¹ And, depending on the case and the jurisdiction in question, further laws might apply, for example, in the framework of unsolicited telephone calls or commercial e-mails. Such communications, as opposed to postal advertising which was privileged under German data protection law, always required specific legal checking.

²⁹² So-called “responsive web-design”, see <http://blog.freedomscientific.com/responsive-web-design-why-one-site-can-behave-differently-on-different-pcs-and-browsers/> for background information. Retrieved September 26, 2021.

Retrieved September 26, 2021.

²⁹⁴ ICO describes cookies as “a small file of letters and numbers that is downloaded on to your computer when you visit a website. Cookies are used by many websites and can do a number of things, e.g. remembering your preferences, recording what you have put in your shopping basket, and counting the number of people looking at a website”, see <https://ico.org.uk/your-data-matters/online/cookies/>. Retrieved September 26, 2021.

²⁹⁵ Frederik Zuiderveen Borgesius, Joost Poort: Online price discrimination and EU data privacy law, *Journal of Consumer Policy* 2017, vol. 40, issue 3, pp. 347-366.

legitimate interests has been the subject of numerous publications.²⁹⁶ Moreover, the Privacy and Electronic Communications Regulation (PECR) also covers cookies and the use of similar technologies for storing or accessing information, including technologies like device fingerprinting.²⁹⁷ As a result, such an approach is as tempting as it is legally demanding.

4.2.4. Fraud prevention and compliance issues

Fraud prevention is a good example of how Big Data applications can help businesses to achieve legal compliance as, e.g., the banking sector is obliged to perform background checks and to permanently screen transactions to fulfill requirements which arise from various sanction lists.²⁹⁸ Big Data analytics can also be very helpful when companies want to detect suspicious activities to prevent and fight fraud. This is especially important to e-commerce as there are specific challenges in the area of distance selling, for example, the identification of the customer, address verification, credit assessment and the like.²⁹⁹ Because companies do not want to risk customer dissatisfaction through service delays or payment rejections, they turn to device or geo-location or even social media data analysis to perform real-time-checks for suspicious activities³⁰⁰ so that the (online) customer journey is neither interrupted nor disturbed. This approach is comprehensible from a business point of view in terms of protection from possible financial risks arising from fraud.³⁰¹ But it should not be forgotten that such procedures are questionable³⁰² with regard to transparency requirements vis-à-vis data subjects; an average buyer does not suspect that a simple online order leads to a variety of background checks including devices and online activities, and it might therefore not cross his mind to read (extensive) privacy notices prior to the purchase.

4.2.5. Sense-making

In the context of Big Data analytics, a new class of analytic capability emerged which may be characterized as (general purpose) sense-making. This approach relates to a new type of technology

²⁹⁶ For instance, Richard Steppe: Online price discrimination and personal data: a General Data Protection Regulation perspective. *Computer Law & Security Review* 2017, vol. 33, issue 6, pp. 768-785.

²⁹⁷ See ICO at <https://ico.org.uk/your-data-matters/online/cookies/>. Retrieved September 26, 2021.

³⁰⁰ For instance, the German company named RiskIdent. Background information on their services and the way they work is available at <https://riskident.com/de/technologie/>. Retrieved September 26, 2021.

³⁰¹ Also offered by the German company Arvato Financial Solutions as explained on their website <https://finance.arvato.com/de/financial-solutions/fraud-management/fraud-detection.html>. Retrieved September 26, 2021.

³⁰² The question is also whether or consent or legitimate interests shall serve as legal basis.

which helps organizations to make decisions faster and better. Unlike master data management which helps businesses to gain control over information in order to have consistent and reliable master data records, sense-making is about making sense of “their diverse observational space, ranging from data they own and control (e.g. structured master data) to data they do not or cannot control (e.g. externally-generated and less structured social media”.³⁰³ Sense-making suggests that an organization can only be as smart as the sum of its observations collected across various enterprise systems,³⁰⁴ and this is where Artificial Intelligence comes into play:

4.3. Types of Artificial Intelligence

4.3.1. Rule-based Artificial Intelligence

There are many forms of Artificial Intelligence; traditional algorithmic AI is rule-based, and therefore often compared to a recipe, including more or less of ingredients, and therefore leading to more or less accurate results. Rule-based Artificial Intelligence is the simplest form of AI³⁰⁵: knowledge is achieved by applying a set of rules.

4.3.2. Search and planning Algorithms

In the age of Internet, probably the most prominent examples of Artificial Intelligence are algorithms that are used frequently to search for all kinds of goods, items, hints or suggestions. Search algorithms are very useful type of AI, but their problem-solving capacities can be limited depending on their ability to take constraints into account. That is why search algorithms are often combined with planning (and / or scheduling) algorithms.³⁰⁶

³⁰³ Background information on the issue is provided by Jeff Jonas: Master data management vs. sensemaking, Article published November 11 2011, available at http://jeffjonas.typepad.com/jeff_jonas/2011/11/master-data-management-mdm-vs-sensemaking.html. Retrieved September 26, 2021.

4.3.3. Symbolic Artificial Intelligence including Expert Systems

Symbolic Artificial Intelligence was the main area of interest in the early decades of AI research³⁰⁷ and the first important step to design computers to assist humans in with complex decisions. This approach is also known as classical Artificial Intelligence and encompasses all AI methods that are based on symbolic, i.e., human-readable representations of problems, logic, and search.³⁰⁸ Since this type of AI helps experts in various professional domains to make their decisions, such symbolic AI systems are called Expert Systems. Expert Systems are knowledge repositories used to gather human expertise and to replicate that knowledge³⁰⁹. The first such system was already introduced in 1965.³¹⁰ Even though Symbolic Artificial Intelligence led to significant advances in the understanding of cognition, symbolic AI has fallen by the wayside as Neural Networks gained traction.³¹¹

4.3.4. Knowledge Engineering

Knowledge Engineering is a field of Artificial Intelligence that aims at imitating the way humans think and approach problems; Knowledge Engineering is used in decision support software and similar to Expert Systems³¹², it imitates the judgment of human experts by codifying knowledge as rules and relationships between data,³¹³ but is specific insofar as it tries to provide solutions for today's information explosion: e.g., in the area of taxation³¹⁴, it is hard to keep pace with ever-changing rules and regulations. This is a where Knowledge Engineering could help by using various algorithms, from

Retrieved September 26, 2021.

Natural Language Processing to interpret laws to graph representations to find the relationships of new rules to previous instances. However, a challenge in the field of Knowledge Engineering is the capture of tacit knowledge³¹⁵: it was soon discovered that human experts also rely on collateral data and that the interaction between explicit and tacit knowledge is vital for the creation of new knowledge.

4.3.5. Robotics

Robotics are used in various domains: they can be used in the industry to handle material, they can be used in the medical sector able to perform complex surgeries, and they can be used or for exploration purposes or even for the military as robots (including drones) can reach inaccessible, hazardous zones or to identify and destroy life-threatening objects. Especially these military use cases show the ethical implications of certain types of Artificial Intelligence; data protection is a lesser issue here, and there are further legal issues, for example the handling of machine data, non-personal information, data ownership or questions of own legal personality. It can be generally said that Robotics heavily rely on electrical and mechanical engineering and given the fact that robots in many industrial use cases must be capable of using vision to locate and assemble goods, advances in Robotics will very likely rely on progress in the field of Computer Vision and other forms of machine perception:

4.3.6. Computer sensing and vision

Another form of Artificial Intelligence is Computer Sensing where computers are designed with a range of sensors to enable them to see, listen or taste to assess their environment and, e.g., measure distance or acceleration and speed, temperature as well as light. This type of AI is thus used for augmented machine perception, and at present, Computer Vision is probably the most prominent form of Computer Sensing: computers are able to perform certain tasks like image and video captioning much better than humans could, and far beyond human perception³¹⁶. Owing to the fact that the application domains of this type of AI include biometrics and face recognition³¹⁷, Computer Vision is one of the most

³¹⁵ Dag Prawitz: Tacit knowledge - an impediment for AI? in: Göransson et al.: Artificial Intelligence, culture and language: on education and work. Springer Publishing 1990, available at https://doi.org/10.1007/978-1-4471-1729-2_7. Retrieved September 26, 2021.

³¹⁷ Facial and character recognition techniques generally have a potential for bias and discrimination, and the ClearView case showed how easy it has become to use a single piece of information to identify and track individuals: the company scraped more than three billion facial images from social media sites. The scope of the matter and the lack of legal basis cause the European Commission to consult with national data protection authorities on how to proceed in the case: Samuel Stolton: After Clearview AI scandal, Commission 'in close contact' with EU data authorities. Article published February 12 2020, available at <https://www.euractiv.com/section/digital/news/after-clearview-ai-scandal-commission-in-close-contact-with-eu-data-authorities/>. Retrieved September 26, 2021.

problematic forms of Artificial Intelligence from a privacy perspective: while truly promising medical advancements seem possible by iris diagnostics with the help of AI which even go beyond diagnosing mere ocular diseases,³¹⁸ one and the same AI could cause serious challenges when used in a different setting, for example in the employment context, allowing for the collection of employees' biometric data – like the example of Metaverse, the digital future Mark Zuckerberg is steering shows.³¹⁹ Metaverse³²⁰ is a collective virtual shared space where users can interact, a digital reality that combines social media, augmented and virtual reality, online gaming, and cryptocurrencies.³²¹ Metaverse adds a more complex dimension to today's privacy challenges³²² if employees were forced to use the Metaverse. Computer Vision is also one of the most challenging disciplines from a technical point of view, and that is why Computer Sensing is often combined with other types of AI, including rule-based and symbolic Artificial Intelligence as well as so-called Machine Learning:

4.3.7. Machine Learning

The emergence of Machine Learning (ML) is the reason why millions of users globally enjoy their smart devices and specialized (fitness, banking, weather, etc.) apps without really being able to tell what this type of AI is about. In fact, many people use the terms Machine Learning and Artificial Intelligence interchangeably. But ML is a new form of AI that can be distinguished from traditional Artificial Intelligence since it gives computers the ability to learn from and improve with experience by focusing on learning through patterns and building rules from examples.³²³ Some describe AI as the intelligence and Machine Learning as the implementation of the compute methods which support it.³²⁴ One could therefore speak of Machine Learning as the art of having computers perform without being programmed

in a specific way.³²⁵ Introduced in 2014³²⁶, so-called Generative Adversarial Networks (GANs) are the newest variation of Machine Learning: two neural networks contest with each other, i.e. the second neural network (discriminator) evaluates the other network (generator) in a game to create and refine data (results).

4.3.8. Supervised and Unsupervised Learning

Machine Learning can be roughly separated into supervised and unsupervised (predicted) learning³²⁷ as there are several ways to train algorithms: in a supervised learning model, the algorithm is provided with and learns from a labeled dataset for which the correct outcome is provided so that the network can learn to map inputs to observations and make necessary adjustments to learn for the future. An unsupervised model works with no or minimal human supervision and computers must look for patterns within an unlabeled (unclassified) dataset. Another name for unsupervised learning is knowledge discovery because unsupervised learning is used to find hidden patterns. Between these two main methodological types of Machine Learning lies so-called semi-supervised learning where a system is provided with a small set of labeled examples, and also uses unlabeled information within the same dataset for evaluation and analyzing purposes.

4.3.9. Reinforcement Learning

Alongside with supervised learning and unsupervised learning, Reinforcement Learning is one of three basic Machine Learning paradigms and has been around for some time already: Reinforcement Learning is built on observation³²⁸ to allow for making optimal decisions and complete tasks within an uncertain environment using experiences. The focus of Reinforcement Learning is thus rather experience-driven decision-making than pattern recognition³²⁹: Reinforcement Learning aims at independent learning and performance of human-like goal-oriented tasks. There are more and more practical use cases in this area, and it is likely that Reinforcement Learning will play a vital role in future Robotics.

4.3.10. Neural (Connectionist) Networks

An Artificial Neural Network (ANN) is inspired by the idea of imitating the human brain: computers are built in a manner suggestive of the connections between neurons in a human brain by using silicon and wires which act similar as dendrites and neurons.³³⁰ Neural Networks use processors which are interconnected and are able to learn by a process of trial and error. One of the pioneers in this area defined a neural network as a computing system made up of a number of simple but highly interconnected processing elements that process information by their dynamic state response to external inputs.³³¹ The emergence of Artificial Neural Networks was a crucial aspect for the advancement of Artificial Intelligence.

4.3.11. Deep Learning

Deep Learning is part of Machine Learning³³² and uses Neural Networks that work with artificial neurons.³³³ This area of Artificial Intelligence uses Neural Networks that are layered in a manner that allows for interaction between input and output values, i.e., passing back and forth input and output data with the help of mathematical functions so that new information is generated. This type of processing has helped with object and activity recognition and enabled progress in specific areas of perception, e.g., audio or speech.³³⁴

4.3.12. Natural Language Processing

Natural Language Processing (NLP), which is often combined with automatic speech recognition, is one of the most common forms of Artificial Intelligence: “Siri”, “Alexa”, “Cortana” are prominent examples of (home-based) assistants, and the growing Internet connectivity of devices and appliances (Internet of Things) will further reinforce this. “DeepL” is a good example of how far machine translation has come

in the recent years, and the debut of “ChatGPT” has recently drawn a great deal of attention due to the fact that it can generate high-quality responses. The shift in NLP is to move away from systems that allow for real-time interaction with, e.g., customers to genuine dialogue.

The above-mentioned instances do not represent an exhaustive description of all types of Artificial Intelligence. To summarize the above enumeration to a certain degree, below is an overview of the most used types of Artificial Intelligence:³³⁵

Symbolic AI	Human-readable logic problems
Rule-based AI	Deductions based on curated rules
Search	Steps from initial state to goal
Planning & Scheduling	Multi-dimensional strategies and action sequences
Computer Sensing	Using human sense-based inputs
Robotics	Mobile AI and multi-sensing
Expert Systems	Complex solutions through reasoning
Knowledge Engineering	Technology behind expert systems
Machine Learning	Improvements through experience
Deep Learning	Using multiple layers of neural networks
Reinforcement Learning	Learning to a complex task
Natural Language Processing	Understanding and interpreting language
Neural Networks	Learning by making connections

4.4. Use cases of Artificial Intelligence

There are countless use cases of Artificial Intelligence:³³⁶

Retail	Virtual mirrors, cashless stores
Mobile	Voice to text, smart personal assistants
Hospitality	Predictive supply chain, concierge services
Media	Automated journalism, identification of fake news
Insurance	Risk identification, client support, personalized pricing

³³⁵ The overview is based on a document provided by Brenda Leong of the Future of Privacy Forum called “The spectrum of Artificial Intelligence”. Infographic published December 14, 2020, available at <https://fpf.org/blog/the-spectrum-of-artificial-intelligence-an-infographic-tool/>. Retrieved September 26, 2021.

Guideline published 2019, available at https://www.bitkom.org/sites/default/files/2020-02/200203_I_f_ki-in-der-industrie_0.pdf. Retrieved September 26, 2021.

Cyber-security	Incident detection and accelerated incident response
Gaming	Improved visual quality, 3D-Avatars, thought-controlled gaming
Education	Plagiarism detection, digital learning interfaces, virtual teachers
Banking & Finance	Fraud prevention, credit decision making, client segmentation
Smart homes	Personal assistants, home security, automated good ordering
Transport	Travel time reduction through traffic analytics, autonomous vehicle
Agriculture	Robot harvesting, computer vision to monitor soil health and needs
Real Estate	Market and price analysis, client segmentation, targeted advertising
Entertainment	Music and TV suggestions, search optimization, personalization
Defense	Target identification, autonomous weapons, simulations, training
Communications	Spam filters, real-time translation, emotion analysis, text suggestions
Online Shopping	Search recommendations, customer services and sales chat-bots
Social Networks	Photo recognition, chat-bots, friendship suggestions, personalization
Workplace	Robotics, automated checks in factories, enhanced recruitment
Healthcare	Virtual doctors, surgery robots, drug discovery, enhanced diagnostics
Politics & government	Targeted campaigning, public opinion monitoring, predictive policing

4.5. Benefits and challenges of Big Data and Artificial Intelligence

Big Data and AI applications are attractive for companies since they allow for analytics, customer insights, forecasting, decision-making, and the optimization of processes, products, quality and services.³³⁷ Big Data and AI can help to better understand market conditions and customer needs and such applications are therefore valuable for product development and overall innovation to achieve the desired competitive advantage; the same applies to necessary adjustments to reflect external and internal developments that can be better monitored with corresponding tools, even for reputation control.³³⁸ From a company perspective, Big Data and AI are particularly useful for increasing productivity, managing inventory manufacturing, delivery and distribution and fostering preventive maintenance.³³⁹ This technology can thus improve operational efficiency and optimize business outcomes.³⁴⁰ Big Data and

AI have proven to be valuable: so-called smart grids, traffic management as well as the medical sector as well as mobile and online applications are further important uses,³⁴¹ and based on existing experience thus far, it can generally be said that the use of Big Data and AI typically goes along with time reductions and cost savings.³⁴² In the last years, there has been an increased awareness with regards to these benefits, and this resulted in corresponding investments in the relevant infrastructure. Consequently, retail and insurance companies as well as financial institutions and governments use Big Data for various purposes, e.g., for the improvement and tailoring of products and services, for the assessment of churn rates, creditworthiness or other risks including detection of potential fraud and abuse, and they all follow their own Big Data value chain, from data collection to storage and analysis and the use of the results.³⁴³ The maturation of Big Data and AI software was also an important factor for the growing success of such applications. It can therefore be concluded that Big Data and AI drive growth for those companies that know how to take advantage of “data-driven decision-making”³⁴⁴ for their business. Conversely, the inability of an organization to benefit from the information it possesses can result in what is called “enterprise amnesia”.³⁴⁵ Despite of the existing potentials of Big Data and Artificial Intelligence in terms of analytics, mining, reporting, simulation and visualization, it should not be forgotten that evaluations that are based on Big Data and AI do not automatically lead to correct or meaningful results: e.g., a correlation was proven between the rise in stock market prices and Superbowl results; the same applies to the correlation between the susceptibility of Angina Pectoris and the individuals with the zodiac sign Aquarius.³⁴⁶ It is difficult to capture meaningful results as algorithms do not dispose of social skills³⁴⁷ or the intuition to discard patterns if need be. This is especially true for behavioral analytics since human behavior is not only guided by reason, but often driven by emotions. To provide a very simple example, it cannot necessarily be assumed that the frequency of clicking on certain messages is in an indicator for

their importance to the user.³⁴⁸ And there are always two sides of the medal, while Big Data and AI may be beneficial businesses, there seems to be a price tag for individuals: health data management is valuable, but dependent on very sensitive data; traffic management is desirable but could lead to seamless tracking of motion patterns based on geo-location data, and the same is true for data collected from mobile devices. There have been reports that operating systems are transmitting a lot of user data even if users deliberately switch off certain services such as location-based services.³⁴⁹ So-called smart meters electricity suppliers started using some years ago are very useful for billing purposes. But smart meters are able to transmit power consumption levels within short intervals, and as a result, suppliers have detailed information about the intensity of the usage of household devices – sensors work so precisely that they can even capture which TV channels have been watched.³⁵⁰ Smart meters thus allow for a detailed analysis of customer usage behavior, and that implies privacy risks.³⁵¹ In addition, smart meters are also a good example for unexpected results: consumption data clearly show whether and how many people have been present in certain premises for a certain period of time. Therefore, smart meter data could be used in tax matters and may serve as evidence if a taxable (primary) residence is in question. Big Data and Artificial Intelligence can generally only create value if the delivered results and conclusions are meaningful. However, the problem is that any decision-making process is based and dependent on a high number of other, underlying decisions, and that makes the process vulnerable to errors which vary in complexity, their consequences and in the extent to which they can be influenced. It is important to note that various errors can occur in every single phase of the design and decision process:³⁵² errors can already occur during the design phase of algorithms or when the automatic decision-making system is constructed; operationalization errors can lead to results which cannot be interpreted in a meaningful manner. Finally, errors may occur when users fail to recognize poor data and / or when they misinterpret results. The factual challenge is that, on top of a multitude of legal questions that arise when Big Data and Artificial Intelligence are in question, there is a high potential for failure as every single phase of the automatic decision-making process is theoretically error-prone: even correct data may lead to wrong decisions, because users' conclusions may be wrong, and because users can influence results by the way

the dataset is defined or by the way the algorithm is written.³⁵³ After all, decision-making with the help of Big Data and AI in many cases still means interpretation of results by individuals, and this is where (human) mistakes come into play. In this context, it is important to note that some authors³⁵⁴ claim that next generation smart information management systems can reduce false positives and false negatives because they are able to deal with plausible variations and that context-accumulating systems will automatically determine if new observations reveal something of sufficient interest to provoke a reaction rather than data scientists asking questions to the system. Businesses will for sure welcome such developments, but from a data protection perspective, responsible innovation including privacy-enhancing elements should be applied to prevent harms for individuals.

4.6. Potential risks of Big Data and Artificial Intelligence

4.6.1. Data aggregation and maximization

Since Big Data lives on processing of large and growing datasets, the principle of data minimization as set forth in GDPR Article 5 (1) lit. c may well be affected since Big Data is about turning volume to value.³⁵⁵ Fact is that more and more data is being generated and processed: 2.5 quintillion bytes of data are created each day, and that pace is accelerating with the growth of the Internet of Things.³⁵⁶ Big Data and AI are on the rise: 77 percent of the devices we use today feature one form of AI or another; owing to AI, global GDP may grow to \$ 15 trillion by 2030 and the overall AI market is expected to be almost

\$ 60 billion by 2025.³⁵⁷ In the next ten years, almost 70 percent of all companies will adopt at least one type of AI.³⁵⁸ AI's potential is so broad that some speak of it as the fourth industrial revolution.³⁵⁹

4.6.2. Secondary use and use of collateral data

(Compatible) reuse of personal data is admissible³⁶⁰ to the extent the conditions of GDPR Article 6 (4) are met,³⁶¹ i.e. considering the nature of the data in question, the context in which the data were collected, the relationship between the purposes for which the data have been collected and the purposes of further processing, the impact of the envisaged data processing on the data subjects, and the safeguards applied by the controller. Since a major characteristic of many AI applications is a certain degree of autonomy with systems being able to perform in an unsupervised manner, it is questionable whether such data processing operations meet all these requirements. Another problem of Big Data applications is that, quite often, external data are processed.³⁶² The upload of address books to social media platforms is a simple, but good example of this risk: whenever a user uploads his individual contacts to a social media platform, the platform receives a full set of contact data, and the concerned individuals behind those data do not know anything about this, not to mention that they never consented to such information sharing. This type of data processing is not transparent and can hardly be considered lawful: it is true that users upload the data; the platform was not actively collecting or harvesting data, but the platform as the controller acted as an enabler since it was the platform which implemented and activated the corresponding functionality – while another useful feature, (at least) information of concerned data subjects through communication channels the platform can dispose of, is not a default. However, some platforms used e-mail addresses which were uploaded by other users for other (own) purposes, which

courts considered to be illegal advertising.³⁶³ Mergers & acquisitions are also a typical example of how companies may end up breaching data protection³⁶⁴ (and / or consumer protection, competition or anti-trust) laws.

4.6.3. Opaqueness

One problem in the field of AI is that quite often, important parameters are unknown, e.g., details of the processing, the decisive (set of) operators behind the algorithm, etc. Some argue that there are three distinct types of opaqueness which can be distinguished:³⁶⁵ intentional opacity when the inner workings of the system are deliberately concealed; illiterate opacity when the inner workings are opaque since only those with expert knowledge understand how it works; intrinsic opacity due to a fundamental mismatch between how humans and how algorithms understand the world. The ability of AI to act autonomously and in unforeseeable ways adds to the fear that decisions about individuals may be made by a “Kafkaesque system of unreviewable decision-makers”.³⁶⁶ Another imminent problem is that the outcome of AI applications is often based on statistical correlations, not causality, and that is why some believe that AI shall attempt to identify causal relationships.³⁶⁷ However, some companies engage in the “fight against black box algorithms”³⁶⁸ with a new set of open source software to help understand how Artificial Intelligence is making decisions.

³⁶³ On January 14, 2016, the German Federal Supreme Court has ruled that the "find friends" feature of Facebook, which is also used to email people who are not registered on Facebook, constitutes unlawful (harassing) advertising: decision Az. 4.6.4. Human oversight

A variety of factors contribute to the problem that human oversight is an issue in the framework of Big Data, ADM, and AI applications: the specialty about AI is that systems are able to autonomously perform certain tasks to achieve specific goals,³⁶⁹ that they can recognize meanings by extracting characteristics and patterns³⁷⁰ and learn (and teach) themselves without being programmed in a specific way. Processing operations may therefore lead to decisions which are opaque since they lack transparency and reproducibility, and that also questions the fairness and reliability of results which may be incorrect or even inappropriate (biased). If data is merged from various datasets, traceability is yet another issue to consider which conflicts with controllers' accountability.³⁷¹ A worst case scenario would be that unknown (secret) processing takes place and that the controller lost control or is simply not aware of what is going on. The fact that many services are outsourced to a multitude of specialized vendors further contributes to the potential risk that human oversight may be threatened; in many cases, it may therefore be difficult to define the true operators.

4.6.5. Information mismatch

Companies must be transparent about the processing of personal data,³⁷² but they are not obliged to provide detailed information about the data processing. For example, GDPR Article 13 (2) lit. f limits the transparency obligation to information about "the existence of automated decision-making, including profiling, referred to in Article 22 (1) and (4) and, at least in those cases, meaningful information about the logic involved, as well as the significance and the envisaged consequences of such processing for the data subject". Details about the significance as well as envisaged consequences of the processing are relative insofar as dynamic processing may perhaps not allow for foreseeing all relevant consequences.³⁷³ Details about the underlying logic are relative insofar as meaningful information is not the same as comprehensibility or reproducibility of decisions and insofar as businesses may refer to

Background information on CCPA can be found on the website of the State of California Department of Justice, Office of the Attorney General at <https://oag.ca.gov/privacy/ccpa>. Retrieved October 23, 2021.

³⁷³ Whenever processing operations are subject to ongoing change, data protection risk assessments will be an on-going process, and not a one-time exercise, Article 29 Data Protection Working Party: Guidelines on Data Protection Impact Assessment (DPIA) and determining whether processing is likely to result in a high risk for the purposes of Regulation 2016/679 (WP 248), p. 13.

trade secrets in order not to disclose underlying algorithms they use.³⁷⁴ Another point that adds to the mismatch is the dilemma of information asymmetry between users and (Internet) service providers.³⁷⁵ Information requirements are not only common to European law but are also part of so-called Fair Information Practice Principles (FIPP) which have been adopted in many US-laws.³⁷⁶ FIPPs and many other privacy frameworks³⁷⁷ have in common that individuals must be able to know which information is held about them and correct records of personal information if need be. Even if lack of transparency is not the problem, transparency as such is problematic since the ineffectiveness of transparency requirements seems to be proven by now: people are as badly informed as they are overtaxed with long and complex privacy notices;³⁷⁸ people routinely turn over their data for small benefits;³⁷⁹ people care much more about price-sensitive information than about data protection information;³⁸⁰ people are much more concerned about social privacy than about institutional privacy,³⁸¹ and if people are about to decide about their privacy preferences, they tend to make their lives easy and accept all default settings³⁸² rather than taking their time to really comprehend and decide on relevant settings.

4.6.6. Privacy self-management

Lack of transparency is also related to data subject rights: there is good reason why GDPR Article 12 covers both, transparent information, and modalities for the exercise of data subject rights, because being aware who holds which data is a prerequisite for exercising individual rights. GDPR stresses the right

to information in the framework of multi-purpose processing since GDPR Article 13 (3) requires that individuals be (repeatedly) informed if the controller “intends to further process personal data for a purpose other than that for which the personal data were collected”. A draft version of the ePrivacy Regulation pursues the same goal by introducing the duty to remind users of their right to withdraw their consent unless users decide not to receive such reminders.³⁸³ The idea of privacy self-management has been further developed into a fundamental right that is also known as “informational self-determination”: In Germany for example, the federal constitutional court dealt with a case regarding the collection of personal information during the 1983 census, and whether or not individuals shall determine the collection, storage, use or disclosure of their data.³⁸⁴ In this decision, the court introduced the concept of “informational self-determination” for the first time. This concept deals with the right to a private life, and the protection of privacy and personal data.³⁸⁵

4.6.7. Potential for manipulation and addiction

Connected to the problem of privacy self-management is the potential for manipulation and addiction³⁸⁶ which may reduce (risk-)awareness and this way, further reinforce loss of control.³⁸⁷ While people are aware that companies have a strong interest to make their products and services attractive, many people may not be aware that certain apps take advantage of psychological patterns:³⁸⁸ so-called behavioral engineering consists of features like a never-ending stream of irresistible content, gamification that encourages users to contribute their own content, infinite scroll that ensures users never break their attention, or real-time information that results in a constant fear of missing out.³⁸⁹ Applications may be designed in a manner that can lead to digital addiction, a serious phenomenon that caught the World Health Organization’s attention since it may result in the inability to manage time, attention, and

energy.³⁹⁰ Moreover, research on pathological Internet use shows that digital addiction often leads to anxiety, depression,³⁹¹ and loneliness – a problem that should not be underestimated as the lack of real life contacts up to complete social isolation already became a mass phenomenon, an epidemic³⁹² with its own name in some countries,³⁹³ and its own ministry in others³⁹⁴ – because it was identified as a serious risk for public health. It is therefore questionable whether it is fair to say that individuals make a conscious choice to spend a lot of time on social media.³⁹⁵ Last, but not least, the lack of (pay-per-view) fees shows that there is no financial incentive to minimize the amount of time people spend on social platforms, and that the collection of personal information provided and / or generated by users may serve as the basis for the monetization of individuals' behaviors.³⁹⁶ Given the implications for consumer privacy, various laws have been enacted to address the potential for manipulation by explicitly prohibiting manipulative design, mostly with a focus on consent: if consent is obtained through manipulation, it is neither informed nor freely-given.³⁹⁷

4.6.8. Increase of paradoxes

There is much enthusiasm around Big Data as it is believed to be a powerful tool which enables detailed insight into many different economically valuable aspects of life. However, this seems to be only true for Big Data users since Big Data applications, pools and sensors are predominantly in the hands of powerful intermediary institutions, meaning that large corporate entities³⁹⁸ are privileged at the expense

of individuals.³⁹⁹ This “power paradox” is accompanied by the “transparency paradox”: Big Data lives on small data inputs which, when viewed in isolation, appear unimportant and unsuspecting. The problem is that especially online data collection is much more far reaching and much more detailed than users would expect, and that underlying tools and techniques that are used for decision-making are opaque.⁴⁰⁰ Therefore, some compare interactions with Big Data platforms with a poker game “where one of the players has his hand open and the other keeps his cards close”.⁴⁰¹ Transparency is a topic GDPR explicitly stresses,⁴⁰² but transparency and consent seem to be an unfortunate issue since privacy self-management in many instances is about a take-it-or-leave-it-approach⁴⁰³ or a mere click-mechanism.⁴⁰⁴ Even though the EDPB⁴⁰⁵ and the Court of Justice of the European Union clarified some questions regarding the use of cookies,⁴⁰⁶ the ePrivacy Regulation is yet to come⁴⁰⁷ so that there is still a lack of clarity with regard to consent requirements.⁴⁰⁸ The described phenomenon is summarized under the term “control paradox” which also deals with the problem that affording more control to users does not help them to better protect their privacy.⁴⁰⁹ The opposite effect is true:⁴¹⁰ not only does affording more control to users not lead to better protection of their data – this may even induce them to reveal

more sensitive information: if people feel that they have control over their data, they tend to provide more data about themselves.⁴¹¹ Similar effects are known from other fields, e.g., in the framework of the introduction of the safety belt legislation: people felt more secure with safety belts and drove less carefully.⁴¹² Another effect may be described as the “trust paradox”: people are nowadays so used to relying on all kinds of Apps as “single source of truth” that they there does not seem to be any more room left for own decision making,⁴¹³ and that has a direct impact on how we deal with both, our own responsibility and others’ trustworthiness in the event that an App’s decision is challenged. The control paradox goes hand in hand with the so-called “security paradox”:⁴¹⁴ data protection and data security are inseparable, and that is why security measures such as access controls are principally indispensable from both, a controller and user perspective. But any such measures require the processing of log-in data, and the general risk is that the more data are processed, the larger the risks that data are somehow compromised. Depending on the case, only name and password are required, but more and more often, users are required to provide a fingerprint in the framework of the authentication process, and that may lead to severe risks: nowadays many devices require the use of biometric data,⁴¹⁵ but the problem is that, unlike a password, there is no reset process for a unique fingerprint, and what is worse: such data can be manipulated very easily.⁴¹⁶ For instance, access to a used object is sufficient to reproduce a fingerprint, and if fingerprints are a mandatory part of official ID-documents,⁴¹⁷ then the individual concerned has a serious problem when such data is abused. Consequently, supposed security mechanisms themselves may lead to further risks. Even the COVID-19-pandemic is an example of such potential paradoxes when people “give up private information (... and) weigh up the costs and benefits in a “Privacy Calculus”.”⁴¹⁸ The paradox at implementation level is that, even if stakeholders are

determined to comply with privacy standards, the introduction of an AI system may lead to privacy problems since there is a risk for potential trade-offs between different data protection principles. In this regard, the UK's Information Commissioner's Office⁴¹⁹ explains that such tensions may arise between accuracy and fairness vs. privacy, and fairness vs. accuracy as well as explicability vs. accuracy and security, e.g., more data may lead to more accuracy, but at the expense of individual's privacy; if AI is tailored to avoid discrimination (if certain indicators are removed to that AI is fair), this may have an impact on accuracy; if AI is tested to see if it may be discriminatory, it needs to be tested by using data that is labeled by protected characteristics, but that may be restricted under privacy laws that govern the processing of special category data; providing detailed explanations about the underlying logic of complex AI systems may lead to disclosure of information that can be used to infer private information about the individuals whose personal data was used to build the AI system.

4.6.9. (Re-)Identification and identity

Even though one single piece of information may not very telling,⁴²⁰ combined datasets tell more about the person and enable to form a picture of the individual; therefore, aggregated information can reveal new facts about a person the individual did not expect to be known when the original (isolated) data was collected.⁴²¹ It is frightening to see how little information is needed to associate information to an individual: a study of credit card records showed that only four spatiotemporal points are enough to uniquely re-identify 90 percent of individuals and that knowing the price of the underlying transaction increases the risk of re-identification by 22 percent.⁴²² Identification of a person is not necessarily a risk, but if one thinks of the importance of the protection of witnesses⁴²³ and whistleblowers⁴²⁴ and the relevance of anonymous speech,⁴²⁵ this shows that the issue of identification may be linked to fundamental rights. The predictive nature of Big Data applications may lead to individuals being identified, and the trouble in this regard is that individuals face difficulties to control the access and use

of their personal data and that they thus do not have sufficient autonomy to determine, maintain and develop their identity.⁴²⁶ Big Data and AI can make individuals' identities potentially more vulnerable, simply because more and more data is available, shared with service providers around the world, and stored in various tools – and any of these systems could be hacked, which may, e.g., enable identity theft. Identity⁴²⁷ theft is a growing issue since advances in digital technology have aggravated the problem. Identity threats and the potential for discrimination are interconnected: in many instances, individuals can neither know nor influence the outcome of evaluations in relation to their preferences, performance, or creditworthiness. Consequently, some authors address the problem⁴²⁸ and some institutions call for a prohibition of so-called secret profiling.⁴²⁹ The core problem is that the outcome of any such evaluation is based on correlations rather than causes,⁴³⁰ and therefore, some speak about data protection as protection against probability.⁴³¹

4.6.10. Potential for discrimination

The probabilistic nature of individual decision-making and profiling is highly desired, but their inherent opacity⁴³² together with their potential for discrimination⁴³³ is problematic: price discrimination by online-shops is just one rather simple example,⁴³⁴ which can be judged from various perspectives, from data protection and consumer protection up to competition law.⁴³⁵ But there are far more examples of

the potential for discrimination and bias in practice with a much greater impact on people's lives, and there are various forms of bias: from implicit bias (discrimination or prejudice against a person or group that is unconscious to the person with the bias, which is dangerous because the person is unaware of the bias) over sampling bias (a statistical problem where random data selected from the population do not reflect the distribution of the population), or temporal bias (when a machine-learning model works well at this time but fails in the future because certain factors / possible future changes had not been considered when building the model), over-fitting to training data (when the AI model can accurately predict values from the training dataset but cannot predict new data accurately), and edge cases and outliers (refers to data outside the boundaries of the training dataset).⁴³⁶ Nowadays, employers are able to turn down job candidates based on social media information without providing candidates with an opportunity to comment on their findings: a study showed that a Meta profile is better at predicting job performance than an IQ test;⁴³⁷ other examples are more severe, for example, biometric identification systems that lead to racial profiling;⁴³⁸ as regards discrimination in the recruitment and / or employment context, it shall be noted that human rights provisions to protect individuals from discrimination exist,⁴³⁹ for example: the International Covenant on Economic, Social and Cultural Rights,⁴⁴⁰ the Revised European Social Charter,⁴⁴¹ the Additional Protocol to the American Convention on Human Rights,⁴⁴² or the African Charter on Human and Peoples' Rights.⁴⁴³ Under the GDPR, any data subject has the right to request information and, under certain conditions, the right to object⁴⁴⁴ "on grounds relating to his or her particular situation", but the key problem is that individuals unlike businesses do not dispose of enough information to defend themselves not just against the data processing as such (which may be legitimate under GDPR Article 6 (1) lit. f, but against "being sorted in the wrong bucket,"⁴⁴⁵ resulting in individuals not succeeding at their jobs or their mortgage. And there are even more dramatic examples

such as facial recognition bias,⁴⁴⁶ bias in recidivism scoring systems,⁴⁴⁷ bias in welfare⁴⁴⁸ or bias in healthcare – detected years after the algorithm had been used.⁴⁴⁹ The potential of information injustice and information inequality leads to the problem that the right to data protection does not help against certain risks and effects of the new economy.⁴⁵⁰ Even if individual automated decision-making would be completely prohibited, this only refers to decisions which have been taken by tools and applications without any human intervention at all. Consequently, the 2019 expert opinion of the German Data Ethics Commission distinguishes between algorithm-based (suggestion-only), algorithm-driven (limited leeway) and fully automated decisions.⁴⁵¹

4.6.11. Potential for surveillance

The potential for surveillance is another important factor to consider when AI technology is used.⁴⁵² Facial recognition is a prominent example in this context and a very sensitive topic;⁴⁵³ the case of Clearview demonstrated how easy it is to identify⁴⁵⁴ individuals. Owing to growing concerns from users and regulators even Meta, the company formerly known as Facebook, announced it will be putting an end to its face recognition system and delete more than 1 billion people’s individual facial recognition

templates.⁴⁵⁵ The fact that some countries introduced so-called social scoring that tracks and evaluates all aspects of life⁴⁵⁶ shows the societal and political dimension such techniques may involve, and some fear that “AI technologies fit into wider systems of over-surveillance, criminalization, structural discrimination” with serious consequences for marginalized people and communities and vulnerable individuals.⁴⁵⁷ Apart from obvious forms of surveillance like CCTV, other techniques may have much more impact on people’s lives, but people are sometimes not really aware of that: the discussion around cookie consent⁴⁵⁸ shed some light to the fact that tracking users’ behavior is of economic interest, but there is little consciousness about the fact that a considerable part of today’s digital economy is not simply about advertising, but about “surveillance capitalism”, i.e., “using human experience as free raw material for translation into behavioral data and usage for hidden commercial practices,”⁴⁵⁹ and the concentration of data⁴⁶⁰ and knowledge may enforce surveillance powers. The fact that AI can not only be used for commercial practices, but for repression purposes led some to conclude that the surveillance industry is out of control because it is selling its products to human rights abusers.⁴⁶¹ The issue of is of such importance that organizations like Amnesty International who campaign against abuses of human rights⁴⁶² dealt with the topic:⁴⁶³ the issue is to protect minorities, marginalized communities or victims of violence, discrimination, or patriarchal structures, which often applies to women⁴⁶⁴ and particularly

⁴⁶⁴ For example, to fight stalking or monitoring, or to protect individuals from violence.

women human rights defenders.⁴⁶⁵ Therefore, the European Parliament and EU Member States started discussing agreements to toughen export rules for European tech companies that sell technology which could be used for espionage and surveillance.⁴⁶⁶ However, some still believe that it is “misleading to assume that all applications of AI can be made compatible with European values, when some applications inherently threaten human rights.”⁴⁶⁷ What is worse, in many cases surveillance is not imposed on people, they buy into it willingly which some describe as the phenomenon of luxury surveillance:⁴⁶⁸ people buy expensive tech products that enable “ambient intelligence,”⁴⁶⁹ a technology where devices slip into the background but are “always on”, meaning that they constantly collect (sensitive) information, or they buy expensive cars that are equipped with multiple internal cameras that allow for constant monitoring of their behavior and actions.⁴⁷⁰

4.6.12. Intrusion

Closely connected to the potential for surveillance is the risk of intrusion, and mobile health apps or virtual / augmented reality may serve as examples of this risk: It can generally be said that health and fitness apps are data-invasive⁴⁷¹ by nature, simply because the performance of such apps is dependent on good data quality, and this is inconceivable without the permanent collection of relevant, i.e., granular data. On the one hand, health applications may be truly beneficial for users by providing them with up-to-date information, analytics, and recommendations on their sleeping rhythm, blood pressure, glucose level, or weight loss progress. On the other hand, a lot of sensitive and intimate⁴⁷² information needs to be constantly processed to deliver these metrics. In the context of mobile health apps, the European

Commission has been facilitating an industry-led Code of Conduct⁴⁷³ with the objective of raising awareness, fostering users' trust in mHealth apps, and facilitating compliance with EU data protection rules. The code has been prepared against the background of the Commission's mobile health consultations which revealed that people often do not trust mobile health apps because of privacy concerns.⁴⁷⁴ Given the psychological and physiological aspects of immersive technologies of virtual and augmented reality, some authors consider such technologies to have the potential for a completely new class of privacy-related harms: the Metaverse, a collective digital reality where users can interact that combines social media, augmented and virtual reality, online gaming, and cryptocurrencies,⁴⁷⁵ may serve as an example in this regard. The massive collection of individuals' biometric data and behavioral information adds to the complexity of privacy challenges, because such data may pave the way to "connect your identity to your innermost thoughts, wants, and desires" and this way, be used for biometric psychography.⁴⁷⁶ To some, this may sound like music of the future, however, applications like Neuralink⁴⁷⁷ show that use cases of brain-machine interfaces in which humans do not need to talk any more, but can transmit their thoughts directly already exist. Some authors name this development the "artificialization of the human."⁴⁷⁸

4.6.13. Human Rights and democracy

The case of Cambridge Analytica is probably the best example of the political dimension⁴⁷⁹ the use of Artificial Intelligence may have. The data mining company Cambridge Analytica had been hired in the 2016 presidential campaign in the U.S. and collected personal information of a large number of users

⁴⁷³ The European Commission's Privacy Code of Conduct for mobile health applications consists of practical guidance on data protection principles for developers of mobile health apps, and covers the following topics: user's consent, data subjects' rights and information requirements, purpose limitation and data minimization, Privacy by Design and by Default, security measures, data retention and data transfers, use of personal data for secondary purposes, disclosing data to third parties for processing operations, principles on advertising in mHealth apps, personal data breach as well as data gathered from children. and their extensive friend networks under false pretenses as a research-driven application.⁴⁸⁰ Facebook transferred 87 million user profiles to Cambridge Analytica, which was one of the largest unlawful data transfers that resulted in investigations by lawmakers and regulators: Mark Zuckerberg, founder and CEO of Meta, had to testify publicly before Congress,⁴⁸¹ and Facebook agreed to pay \$725 million to resolve a class-action lawsuit accusing the social media giant of allowing third parties, including Cambridge Analytica, to access users' personal information.⁴⁸² It is very problematic that AI may be exploited for manipulative purposes or to enhance operations that automate disinformation,⁴⁸³ because people do not realize that troll factories may be used to manufacture specialized (dis-)information,⁴⁸⁴ and that AI could be used to significantly influence voters and this way, the outcome of elections. The so-called BREXIT looks like an important precedent in this context, and Aggregate IQ is the example of yet another data company that played a crucial role in the Vote Leave's campaign – a fact that has been underlined by the chief strategist for Vote Leave.⁴⁸⁵ Phenomena like fake news and hate speech show that it is worthwhile examining AI use cases from a human rights and democracy perspective. The impact of hate speech shall not be underestimated since millions of people use social media every day, and the constant repetition of hate news has the potential to serve as a fire accelerate and cause massive harm since: "When our environment consists of information that polarizes, that enrages, it leads to a loss of trust in each other. This version of Facebook is tearing our society apart and causing violence."⁴⁸⁶

Consequently, organizations like Human Rights Watch,⁴⁸⁷ ARTICLE 19,⁴⁸⁸ Amnesty International and AccessNow⁴⁸⁹ as well as Data & Society⁴⁹⁰ dealt with the analysis of AI and governance from a human rights standpoint and stressed the importance of political participation and freedom of expression. There is good reason why the issue of human rights is part of literally all national Artificial Intelligence strategies and either mentioned explicitly in the framework of the concept of trustworthy AI or referenced because “human rights are often assumed to form the foundation of policy whether or not it is explicitly stated”.⁴⁹¹ At European level, various institutions dealt with human rights implications AI may have and issued corresponding papers, for example, the Council of Europe provided a recommendation regarding human rights impacts of algorithmic systems,⁴⁹² and a study on human rights dimensions of automated data processing techniques and possible regulatory implications.⁴⁹³ In addition, the Council of Europe established an ad hoc Committee on Artificial Intelligence (Committee on Artificial Intelligence of the Council of Europe: CAHAI) whose mission is to engage in broad multi-stakeholder consultations to examine the feasibility of a legal framework for the development, design, and application of Artificial Intelligence, based on Council of Europe’s standards on human rights, democracy, and the rule of law.⁴⁹⁴ CAHAI’s 2020 report⁴⁹⁵ focused on the impact on AI various human-rights-related aspects embedded in ECHR such as liberty, security and fair trial,⁴⁹⁶ private and family life as well as physical, psychological and moral integrity,⁴⁹⁷ freedom of expression,⁴⁹⁸ freedom of

assembly and association⁴⁹⁹ as well as prohibition of discrimination.⁵⁰⁰ CAHAI's report also dealt with red lines such as AI-enabled (personal, physical or mental) tracking, assessment, profiling, scoring or nudging through biometric or behavior recognition, AI-powered mass surveillance, Deep Fakes and human-AI interfaces. It also addresses potential new human rights and the need for:

- *“A right to human autonomy, agency, and oversight over AI,*
- *A strengthened right to privacy to protect against AI-driven mass surveillance,*
- *A separate right to physical, psychological, and moral integrity in light of AI profiling*
- *Adapting the right to data privacy to protect against indiscriminate, society-wide online tracking of individuals, using personal and non-personal data (which often serves as a proxy for personal identification)*
- *A right to transparency / explainability of AI outcomes including the right to an explanation of how the AI functions, what logic it follows, and how its use affects the interests of the individual concerned, even if the AI-system does not process personal data, in which case there is already a right to such information under GDPR.”*

While banal at first glance, even seemingly simple use cases like an online search show that the use of AI can have an impact on the freedom of information: if Artificial Intelligence is tailored and trained to provide suitable suggestions, that may on the one hand help pursue with the online research, but on the other hand, certain results may be disregarded, and this way, important information could be withheld.

Today's AI is so advanced that it has become impossible to distinguish human-generated from AI-generated content: “indistinguishability” has become the benchmark for positive AI performance since the Turing test, and that is why many authors stress the ethical need for more transparency, for example, by adding mandatory watermarks in machine-generated language,⁵⁰¹ which is believed to be a helpful step in the fight against manipulation – and already incorporated in some laws, for example, Canada,⁵⁰² or China.⁵⁰³ In the event that Artificial Intelligence is used in a manipulative manner, that may have a political dimension, for example in the context of persuasion (e.g., creation of targeted propaganda) or deception (e.g., manipulation of videos) or analysis (e.g., evaluation of human behavior, moods and

beliefs) and may thus undermine the ability of democracies to sustain truthful public debates.⁵⁰⁴ This is not only true for totalitarian regimes, any state and any political party nowadays can take advantage of using AI for elections to maximize the effectiveness of email or social media campaigns.⁵⁰⁵ Voter influencing is core of every electoral campaign, but “well-functioning democracies require a well-informed citizenry, an open social and political discourse and absence of opaque voter influence.”⁵⁰⁶ Against this background, one of the pioneers of data privacy concluded that “we have come to realize that how well democracies balance the competing demands of privacy, disclosure, and surveillance will exert a major influence on the quality of civic life in the 21st century, and that shaping this balance will now have to be done in the context of continuing terrorist threats and actions. In short, privacy is a quality-of-life topic worth the best scholarship, thoughtful advocacy, and continuing attention of us all.”⁵⁰⁷

4.6.14. Socio-economic impacts

The debate on the impact of Artificial Intelligence on the economy in general and employment in specific and how Big Data and AI applications will influence and change the job market⁵⁰⁸ are already going on for a long time. Since AI helps with the transformation of businesses, AI will necessarily also have an impact on workforce: we have come to a point where not only monotonous tasks in production lines and factories or activities related to customer care can be automated, complex operations can be automated as well – even the legal profession may be severely impacted by this new kind of virtual workforce, because duties like document classification, summarization, comparison, knowledge extraction, discovery and retrieval are more and more based on technology and automation, and less on

human work.⁵⁰⁹ That is why some raise concerns regarding AI in the employment context⁵¹⁰ or started discussing unconditional basic income.⁵¹¹ Others claim that “robots will take your jobs, government will have to pay your wage.”⁵¹² Some argue that, in the future, workforce may face growing disparities with middle-wage earners losing ground, and that internationally, the lack of access to new technologies in least developed countries will increase inequalities between countries even further.⁵¹³ The impact on AI on the digital economy was also raised by a number of international institutions, for example UNI, the global union federation for national and regional trade unions which is concerned with protecting workers’ rights⁵¹⁴ or the Committee on Artificial Intelligence of the Council of Europe: their 2020 report on the impact of AI on human rights, democracy and the rule of law⁵¹⁵ also addressed the issue of social and economic rights, and G20’s human-centered AI principles⁵¹⁶ not only stress that AI shall be fair, transparent and accountable and that it shall respect privacy, equality, diversity – it also underlines that Artificial Intelligence shall respect internationally recognized labor rights. Fact is that nowadays, even getting a job starts with AI because resume screenings and background checks are very often being automated, and the draft AI Regulation addresses employment and recruitment issues and classifies AI applications used for such purpose / in this sector as high-risk⁵¹⁷ with all its consequences. In addition, existing directives on non-discrimination in the employment context based on religion or belief,

disability, age or sexual orientation⁵¹⁸ or equal treatment of men and women in matters of employment and occupation⁵¹⁹ must be taken into consideration as well.

4.6.15. Liability

A technology like AI that is characterized by systems operating in an autonomous manner leads to yet another issue with regards to AI: liability. While accountability as a value and privacy principle is stressed in most publications, fewer texts deal with the fact that AI has the potential to challenge the traditional notions of legal personality including agency and responsibility.⁵²⁰ The European Parliament dealt with liability issues and published a study on robotics⁵²¹ which deals with liability law solutions in respect of autonomous robots. The European Parliament furthermore issued a resolution on a civil liability regime for AI,⁵²² and a resolution on civil law rules on robotics.⁵²³ Moreover, the European Commission published a report on the safety and liability implications of Artificial Intelligence, the Internet of Things and robotics⁵²⁴ and its Expert Group on Liability and New Technologies issued a report⁵²⁵ on liability for AI and other emerging technologies in which it explains key findings with regards to questions like new duties of care, strict and vicarious liability, the burden of proof for both, causation, and damage, as well as insurance issues. At European level, the AI Liability Directive⁵²⁶ is

probably the most important step towards adding legal clarity.⁵²⁷ The idea of a legal personality for AI and the potential of damages caused by autonomous robots are not the only issues to consider since there are also product liability implications⁵²⁸ and AI might furthermore call for changes to copyright laws.⁵²⁹ If algorithmic decision-making is used in criminal proceedings without human involvement, AI may furthermore have to be examined and assessed in the light of due process requirements.⁵³⁰ AI can thus be examined from various legal perspectives, ranging from data protection, tort liability, copyright authorship and criminal law⁵³¹ – a multitude of areas of liability arises from different use cases of AI. From an individual’s perspective, the question would be whom to turn to: a court⁵³² or a regulator⁵³³ or a company, and if so, which one: from a GDPR perspective, there are controllers, processors and joint controllers; from a DGA perspective there are data holders and data users, and there is not just data but “representations of acts, facts or information and any compilation of the same including sound as well as visual or audiovisual recording,”⁵³⁴ and looking at the categorization of relevant players in the context of the draft AI regulation, the situation becomes even more complex as there are providers, manufacturers, distributors, importers, users – how should an average person without corresponding expertise be able to tell who is responsible for which part and under which conditions, particularly now that the European Court of Justice has clarified the competences of non-lead data protection authorities and has given them greater ability to pursue Big Tech companies which are not headquartered in their

Retrieved October 24, 2021.

territory,⁵³⁵ which also questions the one-stop-shop mechanism that was once believed to be one of the major advancements the GDPR would bring to organizations.⁵³⁶

4.6.16. Security

Security is always an important component⁵³⁷ whenever data processing is in question, and since Big Data and AI are about complex operations, security is a priority in an increasingly digital and data-driven economy and society.⁵³⁸ If security issues are not taken seriously, this may lead to unauthorized (increased) accessibility, disclosure of (sensitive) information and unintended (undesired) inferences⁵³⁹ as well as reputational damage for both, the company using AI techniques and the affected individuals. GDPR, to name just one example of legislation dealing with security,⁵⁴⁰ correspondingly covers various such aspects⁵⁴¹ and Recitals 75 and 76 clearly show that the Regulation pursues a risk-based approach⁵⁴² as it distinguishes between processing activities with a high and a low likelihood and severity to the rights and freedoms of natural persons.⁵⁴³ Consequently, mitigation measures have to be taken into consideration, and these have to be adjusted to the type of information processed, the devices in question as well as access to location of, and retention and preservation of data.⁵⁴⁴ In addition, the operational environment as well as governance, resources and project management, potential conflicts of interest

and issues of ownership, company values and ethics⁵⁴⁵ play an important role to minimize risk – however, all this is based on the traditional view GDPR takes regarding companies as controllers: the true security danger we are facing with AI is that, even though AI can be used for security purposes like intrusion detection,⁵⁴⁶ new systemic risks arise since more and more critical infrastructures⁵⁴⁷ depend on centralized systems with operations that are based on algorithmic (automated) decisions. Another factor to consider is that from both, an individual’s and societal perspective, this technology can “empower malicious actors ranging from cybercriminals to totalitarian states in their desire to control populations”⁵⁴⁸ and this way, may pose a threat to security.

4.6.17. Malicious use of AI

The mere fact that a technology is new does not mean that it will automatically worsen the situation in terms of security. On the contrary, the majority of successful cyberattacks start with a person intentionally or unintentionally fooled into clicking somewhere they shouldn’t; hackers target people because the real weakest link is often the least obvious.⁵⁴⁹ However, fact is also that much more attention has been paid to beneficial applications of AI than the ways in which Artificial Intelligence could be used maliciously, and some predict that the growing use of AI systems will change the landscape of threats, because adequate defenses to potential security threats from malicious uses of AI are not yet developed.⁵⁵⁰ A report surveyed potential security threats in the context of Artificial Intelligence and came to the following conclusions:⁵⁵¹ the use of Artificial Intelligence will expand existing threats and change the typical character of threats, because AI may simply lower the costs of attacks since AI is scalable and can complete tasks that would ordinarily require human labor, intelligence and expertise;

the use of AI for malicious purposes could be especially effective, because it could be finely targeted, difficult to attribute, and thus likely to exploit vulnerabilities (e.g., by using speech synthesis for impersonation), and complete tasks that would be otherwise be impractical for humans (e.g., labor intensive attacks). AI can moreover be used in novel ways, for example by “exploiting human vulnerabilities (e.g., through the use of speech synthesis for impersonation), by exploiting existing software vulnerabilities (e.g., through automated hacking) – or the vulnerabilities of AI systems (e.g. through data poisoning or by introducing training data that causes a learning system to make mistakes or by inputs designed to be misclassified by Machine Learning systems.”⁵⁵² The latter is a particularly interesting aspect insofar as AI itself may be vulnerable as well: if AI systems can exceed human performance, but they may also fail in ways that a human never would. Finally, Artificial Intelligence could also be used in a political context, for example for creating targeted propaganda or to manipulate videos with the help of deepfakes,⁵⁵³ or threaten physical security by subverting systems or through the use of drones.⁵⁵⁴ In consequence, a new quality of malicious actors may emerge, and AI can thus be considered a dual-use technology.⁵⁵⁵ It is therefore necessary to address these dual-use concerns correspondingly and collaborate closely with the relevant stakeholders, researchers and experts to investigate, prevent and mitigate potential malicious uses of AI:⁵⁵⁶ AI’s dual-use character, its efficiency and scalability, its anonymity and psychological distance together with the fact that Artificial Intelligence may exceed human capabilities and that it implies novel unresolved vulnerabilities may lead to serious threats that could affect our security, for example, by criminals training machines to hack or socially engineer victims at scales beyond what humans are doing now or by privacy-eliminating surveillance and profiling, or through automated and targeted disinformation campaigns or by non-state actors weaponizing drones or robots.⁵⁵⁷ However, even seemingly harmless use cases in the online world show the potential for risk: so-called dark patterns,⁵⁵⁸ i.e., methods to misinform or inappropriately influence users’ behavior and manipulate consumer actions, ranging from annoying-but-innocent to unlawful (e.g. checkbox, scroll-down) design, leading to violations of existing laws such as Section 5

of the FTC Act, or consumer⁵⁵⁹ and data privacy laws.⁵⁶⁰ Consequently, the EDPB dealt with the phenomenon and issued guidance on deceptive design patterns in social media platform interfaces.⁵⁶¹ Obfuscatory checkboxes are probably the most common examples of dark patterns,⁵⁶² and dark patterns are not just a side-effect of AI uses, they have become a massive problem as a report by the Princeton research group on popular shopping websites shows:⁵⁶³ the report claims to have found dark patterns in 11% of those websites, and it also identified dozens of third-party entities that offer turnkey solutions enabling sellers to build dark patterns into websites.⁵⁶⁴

4.6.18. Concentration of power

Some say that data is the oil of the 21st century, but that is incorrect because the volume of (machine, sensor, personal, etc.) data keeps growing exponentially⁵⁶⁵ whereas the occurrences of oil are finite. Like every other industrial revolution, “Industry 4.0” has its own challenges and risks – and concentrations of power: we live in a world where a small number of companies has the power to control much of what we do – “Alphabet controls our search and much of our mobile experience, Apple controls the remainder of our mobile and much of our content experience, Amazon controls a large portion of our content experience and much of the Internet of Things, and Microsoft essentially sweeps up everything else,”⁵⁶⁶ and the issue is that, without corresponding future regulation, data may be processed rather in accordance with corporate terms and conditions, and perhaps less with applicable privacy laws. The

concentration of data leads to a concentration of power for those who control the data to an extent that this circumstance is relevant under antitrust law.⁵⁶⁷ So far, the focus of regulation was on personal data and privacy self-management; legislation dealt with specific industries and specific types of data and specific uses cases (processing activities) that may result in risk or may lead to negative consequences for the individual behind the data but not with regulating machine-generated data.⁵⁶⁸ The problem with taking market power into consideration in the framework of regulating AI starts with the fact that the existing legal landscape was not mapped.⁵⁶⁹ However, initiatives like the DGA, DSA and DMA to regulate huge platforms and information gatekeepers are important steps, and this may help to end the “era of light-touch self-regulation.”⁵⁷⁰ Given the multitude of implications arising from AI as a technology and market dominance as a phenomenon, there is more work ahead, but the situation for companies like Meta is getting more and more complicated: in one of the biggest challenges the U.S. government has ever brought against a tech company in decades, the Federal Trade Commission wants to force Meta to sell Instagram and WhatsApp.⁵⁷¹ Unlike the FTC’s case, the £2.3 billion class action lawsuit Meta was facing for unfair trading conditions by forcing users to give up large swathes of their personal data to use the app, and then sell the data to advertisers, was rejected.⁵⁷²

This chapter illustrated in detail the various implications when algorithmic data processing and decision-making are used due to significant impacts on individuals in consequence of opaqueness, information mismatch, concentration of powers, secondary use of data or AI’s potential for discrimination, surveillance, intrusion, or addiction. This is important since it seems that the undisputed benefits and advantages of Big Data, ADM and AI dominate the perception and discussion of such applications, whereas AI could also be used in a manipulative or malicious manner. The chapter also explained the

⁵⁶⁷ The German Facebook case showed that antitrust issues may be a factor to consider, however, the antitrust authority’s ruling that social-media giant abused its dominance was reversed: Article by Sara Germano, published August 26 2019, available at <https://www.wsj.com/articles/facebook-wins-appeal-against-german-data-collection-ban-11566835967>. relevance of this new technology for major principles of data protection laws such as purpose limitation and elaborated on the political and human rights dimension as well as societal implications. These aspects are particularly important as they show the limitations of privacy self-management and the necessity to rethink traditional approaches since such technologies not only pose challenges at individual level, but conceptually question traditional approaches to data protection.⁵⁷³

5. Relevant sources of law

This chapter is a core element of the Thesis as it examines the existing legal landscape from a data protection perspective. The overview starts with rules at international level, with important sources like the Universal Declaration of Human Rights, Convention 108+, the Charter of Fundamental Rights of the European Union, which deal with fundamental rights, including data protection and privacy. At EU level, the chapter presents numerous regulations and directives covering topics like know-how protection, cyber security and product safety, database rights, or equal treatment and discrimination. None of them are essentially about data protection or privacy, but all of them are relevant to complete the picture about the existing legal and regulatory framework for Big Data and AI, and since these laws cover issues like liability, security, or conformity, they are relevant from a data protection, and consequently individual's perspective. Furthermore, this chapter puts focus on the General Data Protection Regulation, for good reason: the GDPR was a major step after decades in which the Directive governed data protection within the EU and strengthened transparency, individual rights, and enforcement powers. Moreover, the GDPR can be considered a role model law, which is shown by the fact that emerging data protection regulations around the globe are matched against the General Data Protection Regulation, for example, Brazil's data protection law LGPD,⁵⁷⁴ China's PIPL⁵⁷⁵ or Japan's act on the protection of personal information.⁵⁷⁶ The examination of the GDPR is of particular interest as it allows for an analysis of the viability and challenges of traditional concepts in data protection law. The chapter also elaborates on further relevant sources of law, for example, national data protection and consumer protection laws, competition as well as labor, equal opportunity laws, and IT-security laws including Internet of Things. Moreover, various sector, industry, or product, purpose, and data specific laws exist which must be obeyed when AI applications and algorithmic systems are used, for example,

for high frequency algorithmic trading, in the employment context, for facial recognition, autonomous driving, or autonomous weapons, medical devices, biometric data and genetic information. The fact that numerous laws that deal with algorithm-based decisions, ADM, and AI as well as purpose, data, and processing specific rules have been enacted show that this area of law is not as immature as one may think; this rather demonstrates the complexity of the legal landscape. In this regard, U.S. legislation is very interesting, not only because the legal framework in the U.S. has become very vibrant in recent years, but also because the impact of laws targeting big tech companies like Google, Microsoft or Meta is not national, but global. Finally, the chapter presents various private-sector initiatives, and concludes with technical standards that are relevant in the context of compliance and (presumption of) conformity.

5.1. International level

5.1.1. United Nations Universal Declaration of Human Rights

In response to World War II, the United Nations (UN) adopted and proclaimed the Universal Declaration of Human Rights in 1948.⁵⁷⁷ The Universal Declaration of Human Rights (UDHR) sets out, for the first time, fundamental human rights to be universally protected, and this includes privacy since UDHR Article 12 sets forth that “no one shall be subjected to arbitrary interference with his privacy, family, home or correspondence nor to attacks upon his honor and reputation. Everyone has the right to the protection of the law against such interference or attacks”.

5.1.2. European Convention on Human Rights

In Europe, there are two systems which ensure the protection of fundamental human rights in Europe, the European Convention on Human Rights (ECHR) and the Charter of Fundamental Rights of the European Union (Charter): The European Convention on Human Rights⁵⁷⁸ was adopted in 1950. ECHR Article 8 states that “everyone has the right to respect for his private and family life, his home and his correspondence. There shall be no interference by a public authority with the exercise of this right except such as is in accordance with the law and is necessary in a democratic society in the interests of national security, public safety or the economic wellbeing of the country, for the prevention of disorder or crime, for the protection of health or morals, or for the protection of the rights and freedoms of others.”

⁵⁷⁷ The text of Universal Declaration of Human Rights is available at <http://www.un.org/en/universal-declaration-human-rights/index.html>. Retrieved September 26, 2021.

⁵⁷⁸ The text of the European Convention on Human Rights is available at https://www.echr.coe.int/Documents/Convention_ENG.pdf. Retrieved September 26, 2021.

5.1.3. Charter of Fundamental Rights of the European Union

The Charter of Fundamental Rights of the European Union⁵⁷⁹ was enacted in 2000 and is a legally binding⁵⁸⁰ human rights instrument, and it also deals with the right to respect for his or her private and family life, home and communications (Article 7), but what is special is that it specifically addresses the protection of personal data: Article 8 of the Charter of Fundamental Rights of the European Union postulates that “everyone has the right to the protection of personal data concerning him or her. Such data must be processed fairly for specified purposes and on the basis of the consent of the person concerned or some other legitimate basis laid down by law. Everyone has the right of access to data which has been collected concerning him or her, and the right to have it rectified. Compliance with these rules shall be subject to control by an independent authority”.⁵⁸¹ Although the Convention and the Charter contain provisions on human rights, they operate within separate legal frameworks:⁵⁸² The Charter of Fundamental Rights of the European Union was drafted by the European Union and is interpreted by the Court of Justice of the European Union. The European Convention on Human Rights was drafted by the Council of Europe⁵⁸³ and is interpreted by the European Court of Human Rights. The Charter constitutes the legal framework for human rights in the European Union, of which the European Convention on Human Rights forms an important part.⁵⁸⁴ Unlike the Charter of the Fundamental Rights of the European Union, the Convention does not contain a specific provision on data protection, but this

⁵⁷⁹ The text of the Charter of Fundamental Rights of the European Union is available at http://www.europarl.europa.eu/charter/pdf/text_en.pdf. Retrieved September 26, 2021.

⁵⁸⁰ The European Union competent to pass legislation on data protection matters based on Article 16 of the Treaty on the Functioning of the European Union and used this competence to include Article 8 on the right to data protection in the Charter.

⁵⁸¹ The question of the relationship between Article 7 and 8 of the Charter is controversially discussed. Some authors consider that Article 8 is *lex specialis*: Sebastian Bretthauer in: Louisa Specht/Reto Manz: *Handbuch europäisches und deutsches Datenschutzrecht* 2019, p. 29.

⁵⁸² Background information on the relationship between the Charter and the Convention is provided by UK’s Equality and Human Rights Commission, a national human rights institution, and is available at <https://www.equalityhumanrights.com/en/what-are-human-rights/how-are-your-rights-protected/what-charter-fundamental-rights-european-union>. Retrieved September 26, 2021.

⁵⁸³ The following background information on various institutions is provided at the Council of Europe’s website, available at <https://www.coe.int/en/web/about-us/do-not-get-confused?desktop=true>: the Council of Europe is an international organization in Strasbourg which comprises 47 countries of Europe. It was set up to promote democracy and protect human rights and the rule of law in Europe. The European Council is an institution of the European Union, consisting of the heads of state or government from the member states together with the President of the European Commission, for the purpose of planning Union policy”. Retrieved October 2, 2021.

⁵⁸⁴ Some authors distinguish these two models of human rights protection as follows: the European Convention on Human Rights is considered to be a “court-centred-model” of protection, whereas the Charter of Fundamental Rights may be considered a “legislative-centred-model”, see Simon Bronitt: *A Tale of Two European Charters of Rights – Comparing the European Convention on Human Rights and the EU Charter of Fundamental Rights*, article available at http://www.academia.edu/6410839/A_Tale_of_Two_European_Charters_of_Rights_Comparing_the_European_Convention_on_Human_Rights_and_the_EU_Charter_of_Fundamental_Rights. Retrieved October 2, 2021.

does not mean that rights of data subjects are not guaranteed within this framework, as steadily growing case law confirms that corresponding control mechanisms are in place.⁵⁸⁵

5.1.4. Council of Europe Data Protection Convention 108+

The Convention for the Protection of Individuals with regards to Automatic Processing of Personal Data⁵⁸⁶ dates to 1980 and addresses challenges for privacy resulting from the use of new information and communication technologies. This convention was the first legally binding international instrument in data protection,⁵⁸⁷ and that is why some believe that the Council of Europe has played a pioneering role the existing data protection legislation.⁵⁸⁸ This view is underlined by the fact that the Council of Europe issued two Resolutions which formulated what later became fundamental principles of data protection law.⁵⁸⁹ While keeping the convention's philosophy, the convention ("108+") has been modernized.⁵⁹⁰ The Council of Europe updated the treaty in 2018 to reinforce the data protection principles of Convention 108, and include additional safeguards to better protect personal data in the digital age, including with regards to international data transfers, and to further strengthen data protection globally.⁵⁹¹ The convention lays down a number of principles which states must transpose into national law to ensure that personal data are processed only for specific purposes, that data are not retained longer than is necessary for the underlying purpose(s), and that the collection and processing of data is not excessive in relation to the purposes.⁵⁹² The modernized convention maintains the Convention's provisions at principle-level, contains technologically neutral provisions, and aims to ensure consistency and compatibility with other data protection legal frameworks, including the European Union's legislation.⁵⁹³ The modernized convention consists of general, simple and concise principles, and allows states parties a certain measure of discretion when implementing them through

their national legislation.⁵⁹⁴ Considering the constantly increasing number of ratifications,⁵⁹⁵ this convention⁵⁹⁶ has the potential to become a global standard.⁵⁹⁷ In addition, Data Protection Convention 108+ may also play a role for adequacy considerations.⁵⁹⁸

5.1.5. OECD Privacy Guidelines

The Organization for Economic Co-operation and Development (OECD) issued guidelines on the “Protection of Privacy and Transborder Data Flows of Personal Data” which were passed in September 1980⁵⁹⁹ and updated in 2013.⁶⁰⁰ These guidelines focus on the practical implementation of privacy protection through an approach which is based on risk management. Consequently, the revised 2013 version also deals with privacy management programs including operational (and data breach) mechanisms.⁶⁰¹ Just like Convention 108, these guidelines also incorporate the principle of purpose specification and the notion of incompatibility.⁶⁰² Apart from these guidelines, the OECD also issued recommendations on cross-border co-operation in the enforcement of laws protecting privacy in 2007.⁶⁰³

⁵⁹⁴ A detailed comparison of the individual regulations within „Convention No. 108” and “Convention No. 108+” is provided by Carlo Piltz and Philipp Quiel: The role of „Convention No. 108” and “Convention No. 108+” as part of the examination of the level of protection in third countries under the GDPR. ⁶⁰³ OECD’s recommendations on cross-border co-operation in the enforcement of laws protecting privacy have been published in 2007, and are available at https://edps.europa.eu/sites/edp/files/publication/2013-09-09_oecd_guidelines_en.pdf. Retrieved October 2, 2021.

Even though OECD's guidelines are non-binding, they can nevertheless be considered a milestone initiative, also because their material content and underlying principles are congruent with the Council of Europe Data Protection convention.⁶⁰⁴

5.1.6. Further Conventions, Resolutions and Guidelines⁶⁰⁵

Privacy is furthermore mentioned in various other legal instruments at international level,⁶⁰⁶ for example Article 14 of the United Nations Convention on Migrant Workers,⁶⁰⁷ Article 16 of the United Nations Convention on rights of the Child,⁶⁰⁸ as well as Article 17 of the International Covenant on Civil and Political Rights (ICCPR).⁶⁰⁹ The United Nations 2015 Guidelines on Consumer Protection⁶¹⁰ define the protection of consumer privacy as a general principle and specify that “businesses should protect consumers’ privacy through a combination of appropriate control, security, transparency and consent mechanisms relating to the collection and use of their personal data” as part of “principles for good business practices”. In 2016, the United Nations moreover issued a resolution on the Right to Privacy in the Digital Age⁶¹¹ in which the UN actively call upon states and upon business enterprises and in which they reaffirm the right to privacy, “according to which no one shall be subjected to arbitrary or unlawful interference with his or her privacy, family, home or correspondence, and the right to the protection of the law against such interference, as set out in Article 12 of the Universal Declaration of Human Rights and Article 17 of the International Covenant on Civil and Political Rights”.

5.2. Global Trade Agreements

When it comes to privacy and data protection at an international level, many think of United Nations Universal Declaration of Human Rights, Convention 108+ or the European Convention on Human

⁶⁰⁴ Unlike the Council of Europe Data Protection Convention, the OECD Guidelines do not mention the need to establish national data protection authorities, a typical (important) element in European data protection rules.

⁶⁰⁵ The difference between these instruments is that some are legally binding, and some are not. Rights and the Charter of Fundamental Rights of the European Union. But the collection, processing and transfer of data including personal information are not only governed by data protection laws (and other areas of law, depending on the specific case in question): there seems to be little awareness that global trade and investment agreements in fact do address the issue of handling (i.e., transfer) of data: rules on trans-border data flows are incorporated in a variety of global agreements, for example the World Trade Organization's (WTO) General Agreement on Trade and Services (GATS)⁶¹², the Comprehensive and Progressive Agreement for Trans-Pacific Partnership (CPTPP)⁶¹³ or the Comprehensive Economic and Trade Agreement (CETA) between Canada and the European Union.⁶¹⁴ These agreements are legally binding and have in common that they set forth (minimum) standards and core norms of non-discrimination, including protections against unjustified data localization requirements: the Trans-Pacific-Partnership (TPP) Agreement, for example, prohibits members from requiring companies located in a TPP country to build data centers in the market countries in which they serve.⁶¹⁵ Consequently, any future legislation which foresees data localization may be challenged owing to the existing overarching trade law framework.⁶¹⁶

5.3. EU level

5.3.1. Regulation (EU) 2016/679 of the European Parliament and of the Council of 27 April 2016 on the protection of natural persons with regard to the processing of personal data and on the free movement of such data, and repealing Directive 95/46/EC

The General Data Protection Regulation⁶¹⁷ replaces⁶¹⁸ the 1995 Data Protection Directive which was adopted when the Internet was in its infancy, at a time when Facebook and so many other things so many people nowadays consider indispensable did not exist. GDPR was introduced as the Data

⁶¹⁸ Further details including a GDPR timeline are available at https://edps.europa.eu/data-protection/data-protection/legislation/history-general-data-protection-regulation_en. Retrieved October 2, 2021.

Protection Directive failed to achieve the desired harmonization⁶¹⁹ throughout the European Union due to different implementation and application of its provisions within various Member States. GDPR's title demonstrates its twin goals, "the protection of natural persons with regard to the processing of personal data and (...) the free movement of personal data."⁶²⁰ GDPR aims at reducing fragmentation and aligning legislation and legislative practice, however, these goals are somewhat questionable due to a rather high number of so-called opening clauses⁶²¹ in important areas like data protection in the employment context.⁶²² The regulation nevertheless marks the biggest shift in data protection laws ever due to its expanded scope and owing to the introduction of a new framework for data protection with increased obligations for organizations including serious penalties for non-compliance.⁶²³

5.3.2. Directive (EU) 2016/943 of the European Parliament and of the Council of 8 June 2016 on the protection of undisclosed know-how and business information (trade secrets) against their unlawful acquisition, use and disclosure

The European Data Protection Supervisor (EDPS) stresses⁶²⁴ the relevance of personal data to the concept of trade secrets, for good reasons: Due to the fact that personal data may form part of a trade secret and given that the holder of a trade secret holder in many cases will also be a data controller if information relating to identified or identifiable individuals is processed, this directive⁶²⁵ is of importance to Big Data applications. The protection of know-how is not only a standard topic in non-disclosure agreements; this new directive will have a direct impact on organizational culture including the dealing with service providers (processors).⁶²⁶ Another aspect is that is generally recognized that, if

an information is a secret, it has a commercial value, and the same is discussed for personal data.⁶²⁷ Know-how protection therefore is another important factor in the introduction of Big Data.

5.3.3. Directive (EU) 2016/1148 of the European Parliament and of the Council of 6 July 2016 concerning measures for a high common level of security of network and information systems across the Union

The European Commission proposed the EU Network and Information Security Directive⁶²⁸ as part of EU's cyber-security strategy which aims at strengthening resilience for providers of critical infrastructure services and applies to sectors such as health and energy, transport, banking, water, as well as digital service providers.⁶²⁹ This directive (also known as the Cyber-security Directive, in brief: NISD) is the first piece of EU-wide cyber-security legislation,⁶³⁰ and even though it does not apply to all companies, it may serve as an orientation in terms of security standards, because all businesses have to take care of the security of processing.⁶³¹ Moreover, it has significant intersections with GDPR in terms of accountability, one of GDPR key elements,⁶³² and it also includes a wide range of organizational requirements (e.g. risk management, incident reporting).⁶³³ NISD and GDPR, however, are not exactly the same as, for example, NISD breach notification requirements extend beyond those of GDPR.⁶³⁴ The European Commission announced to review the NIS Directive by the end of 2020,⁶³⁵ and a political agreement between the European Parliament and EU Member States on the NIS 2 Directive has been reached in May 2022.⁶³⁶

5.3.4. Regulation of the European Parliament and of the Council on ENISA, the "EU Cyber-security Agency", and repealing Regulation (EU) 526/2013, and on Information and Communication Technology Cyber-Security Certification

This regulation,⁶³⁷ also called Cyber-security Act, aims to achieve a high level of cyber-security and cyber resilience, and to reinforce the role of the European Union Agency for Cyber-security as the European Union's center of cyber-security expertise in the framework of a permanent mandate. Among other things, ENISA will be responsible for a cyber-security certification framework. This is remarkable insofar as this initiative is the first internal market law that creates that takes up the challenge of enhancing the security of IoT devices and connected products. This way, a one-stop shop for cyber-security certification will be created that could lead to the removal of potential market-entry barriers and significant cost saving for enterprises, since they would otherwise need to apply for several certificates in several EU countries.⁶³⁸ Businesses could use such certifications to have their security features independently verified and strengthen users' trust in their products and services. In this context, it should also be mentioned that the EU published Digital Operational Resilience Act (DORA), which will be applicable to most financial institutions: DORA aims to consolidate and up-grade ICT risk requirements and establish a streamlined digital operational resilience framework across the EU financial sector; it will include a new oversight framework for critical ICT third-party service providers.⁶³⁹

5.3.5. Regulation (EU) 2018/1807 of the European Parliament and of the Council of 14 November 2018 on a framework for the free flow of non-personal data in the European Union

Unlike the ePrivacy Regulation, the above regulation⁶⁴⁰ is already in force⁶⁴¹ and is part of the EU's digital single market strategy.⁶⁴² Its main goal is to boost and promote the data economy⁶⁴³ by facilitating the cross-border exchange of data and the development of new technologies by removing existing data

⁶³⁷ The text of the regulation is available at <http://www.europarl.europa.eu/sides/getDoc.do?pubRef=-//EP//NONSGML+TA+P8-TA-2019-0151+0+DOC+PDF+V0//EN>. Retrieved October 2, 2021.

localization requirements and at enabling storage of data⁶⁴⁴ in multiple locations across the European Union. New technologies include Artificial Intelligence,⁶⁴⁵ and that makes this regulation particularly interesting to Big Data applications. As for practical implications, it is foreseeable that problems will arise from the demarcation between personal (identifiable) and non-personal data such as aggregate and anonymized data. The fundamental underlying problem is that anonymization is hard to achieve:⁶⁴⁶ an investigation of as little as four spatiotemporal points (credit card metadata) was enough to uniquely re-identify 90 % of individuals behind the data.⁶⁴⁷ This example of reverse engineering shows that it is necessary to rethink and question currently implemented (technical) privacy standards.⁶⁴⁸ Given the growing relevance of machine-generated, non-personal data in the Industry 4.0, some authors stress the necessity of regulations for this type of data as so far, the focus of regulation is with personal data.⁶⁴⁹

5.3.6. Regulation (EU) 2018/1725 of the European Parliament and of the Council of 23 October 2018 on the protection of natural persons with regards to the processing of personal data by the Union institutions, bodies, offices and agencies and on the free movement of such data, and repealing Regulation (EC) No 45/2001 and Decision No 1247/2002/EC

This regulation⁶⁵⁰ concerns the processing of personal data by European Union institutions, bodies, offices, and agencies. It abolished Regulation (EC) No 45/2001⁶⁵¹ which also dealt with the protection of individuals with regard to the processing of personal data by community institutions, and which established the European Data Protection Supervisor to be the independent data protection authority

⁶⁴⁴ With exceptions where data localization restrictions are justified on grounds of public security, see Jörg Hladjk, Undine von Diemar, Olivier Haas and Jonathon Little: European Union: New regulation favors free flow of non-personal data in the EU. which is tasked to ensure that the right to privacy is respected by European institutions and bodies.⁶⁵² It is noteworthy that both, the predecessor and the current version of the regulation contain provisions on compatible processing of personal data, which is important for the interpretation of purpose limitation and thus of relevance to Big Data and AI uses.

5.3.7. Directive (EU) 2016/680 of the European Parliament and of the Council of 27 April 2016 on the protection of natural persons with regard to the processing of personal data by competent authorities for the purposes of the prevention, investigation, detection or prosecution of criminal offences or the execution of criminal penalties, and on the free movement of such data, and repealing Council Framework Decision 2008/977/JHA

Like the GDPR, the Law Enforcement Directive⁶⁵³ also entered into force in May 2018. The directive is a little-known, much overlooked part of the EU data protection reform package.⁶⁵⁴ This directive applies when a competent authority processes personal data for law enforcement purposes, i.e. for preventing, investigating, detecting and prosecuting crimes. In practice, so-called predictive policing relies on AI, for example for the calculation of geographic threat scores.⁶⁵⁵ However, the Law Enforcement Directive also applies to processing that is conducted by private bodies, as long as the processing purpose is law enforcement, meaning that, for example, public transportation may rely on this directive in relation to ticket offences. The applicability of this directive is therefore not limited to the public sector and needs to be evaluated on a case-by-case basis, which can be challenging in the context of public–private partnerships.⁶⁵⁶

Retrieved October 2, 2021.

5.3.8. Directive 96/9/EC of the European Parliament and of the Council on the legal protection of databases

The Database Directive⁶⁵⁷ was enacted as the need for database protection has increased in the digital age, because copying of data at large scale is easy. Although most of the content of social networks was created by the users and not by operators, harvesting of information and personal data on such platforms may infringe the rights of the platform operator.⁶⁵⁸ The directive aims at preventing competitors from skimming off investments by providing a specific (sui generis) property right for analogue and digital databases that is unrelated to other forms of protection such as copyright. The directive protects databases by copyright if they are original; non-original databases such as compilations of legal cases and laws, listings of advertisements or databases of scientific publications can also be protected, if the investment in obtaining, verifying and presenting the data was substantial.⁶⁵⁹

5.3.9. Directive 2000/43/EC on equal treatment and against discrimination and Directive 2004/113/EC on equality in the access to and supply of goods and services

When implementing and applying Big Data analytics and AI applications for eligibility decisions, for example in the context of housing, lending or healthcare, companies should also consider further directives which are primarily concerned with preventing (gender-based) bias and promoting fairness, for example, the directive against discrimination on grounds of race and ethnic origin (Directive 2000/43/EC)⁶⁶⁰ and Directive 2004/113/EC⁶⁶¹ on equality in the access to and supply of goods and services. It can thus be said that discrimination and equal treatment are addressed at EU level, however, these directives have not been discussed in the context of Big Data or Artificial Intelligence.

⁶⁵⁷ The text of the directive is available at <https://eur-lex.europa.eu/legal-content/EN/ALL/?uri=CELEX%3A31996L0009>. Retrieved October 2, 2021.

⁶⁵⁸ Thomas Hoeren: Big Data und Recht, p. 129. C.H. Beck Publishing 2014.

⁶⁵⁹ Background information on the protection of databases is provided by the Commission at their website, available at <https://ec.europa.eu/digital-single-market/en/protection-databases>. Retrieved October 2, 2021.

⁶⁶⁰ The text of the Council Directive 2000/43/EC of 29 June 2000 implementing the principle of equal treatment between persons irrespective of racial or ethnic origin is available at <https://eur-lex.europa.eu/LexUriServ/LexUriServ.do?uri=CELEX:32000L0043:en:HTML>. Retrieved October 2, 2021.

⁶⁶¹ Council Directive 2004/113/EC of 13 December 2004 implementing the principle of equal treatment between men and women in the access to and supply of goods and services is available at <https://eur-lex.europa.eu/legal-content/EN/TXT/?uri=celex:32004L0113>. Retrieved October 2, 2021.

5.3.10. Directive 2000/78/EC against discrimination at work on grounds of religion or belief, disability, age or sexual orientation; see also Directive 2006/54/EC equal treatment for men and women in matters of employment and occupation

Ditto for other directives at EU-level that are concerned with equal treatment at work, for example Directive 2000/78/EC⁶⁶² against discrimination at work on grounds of religion or belief, disability, age or sexual orientation; see also Directive 2006/54/EC⁶⁶³ equal treatment for men and women in matters of employment and occupation. Because the hiring process nowadays often starts with (mandatory) background checks and resume screenings, workplace decisions are very often being (partially) automated, and therefore, Artificial Intelligence plays a role in the employment context.

5.3.11. Directive 85/374/EEC on the approximation of the laws, regulations and administrative provisions of the Member States concerning liability for defective products

Difficulties may also arise from the fact that the existing Product Liability Directive⁶⁶⁴ has not been amended to reflect specific implications Big Data and AI applications may involve: The European Commission has determined that the Directive for Defective Products, which has been in place for over 30 years, requires further work, but is still fit for purpose.⁶⁶⁵ But AI-driven products should be examined in the light of product liability to properly address the risk of accidents⁶⁶⁶ and damage resulting from interaction with humans. The same applies to the General Product Safety Directive⁶⁶⁷ which imposes general safety requirements on any product put on the market for consumers: it should be reviewed against modern safety and security threats as well as present cyber-security standards⁶⁶⁸

⁶⁶² The text of the Council Directive 2000/78/EC of 27 November 2000 establishing a general framework for equal treatment in employment and occupation is available at

5.3.12. Directive (EU) 2019/770 of the European Parliament and of the Council of 20 May 2019 on certain aspects concerning contracts for the supply of digital content and digital services

The Directive on Digital Content⁶⁶⁹ addresses business models in which consumers provide data in exchange for a digital content or service – a phenomenon that has been under discussion for many years within the privacy community. The Digital Content Directive aims to harmonize the legal relationship between consumers and traders for the supply of digital contents and it “gives consumers the right to a remedy when digital content or a digital service is faulty, regardless of whether they paid for it or only provided personal data.”⁶⁷⁰ But the proposal has sparked some controversy for possibly introducing an instrument that acknowledges contracts in which personal data is being treated as contractual “counter-performance”⁶⁷¹ – in times where NGOs like “None Of Your Business” (NOYB) file hundreds of complaints against cookie banners⁶⁷² and paywalls which requires users to “buy back their own data”.⁶⁷³

5.3.13. Directive 2009/22/EC of the European Parliament and of the Council of 23 April 2009 on injunctions for the protection of consumers' interests; Directive (EU) 2020/1828 of the European Parliament and of the Council of 25 November 2020 on representative actions for the protection of the collective interests of consumers and repealing Directive 2009/22/EC

From a company (controller) perspective, the Injunctions Directive⁶⁷⁴ and the Representative Actions Directive⁶⁷⁵ increase the risk of being sued due to unlawful practices under these directives.⁶⁷⁶ From an individual’s point of view, these directives are valuable even though the directives do not primarily deal

with data protection⁶⁷⁷ because they address consumer rights, commercial practices, digital services, or unfair contract terms, which are also governed by another directive:

5.3.14. Directive 93/13/EEC on Unfair Terms in Consumer Contracts

Given the information asymmetries and imbalanced powers between parties, the Unfair Contract Terms Directive (UCTD)⁶⁷⁸ is of relevance for individuals and a good example of the intersection of data protection and consumer protection: the directive aims to protect consumers against unfair standard contract terms and applies⁶⁷⁹ to all kinds of contracts on the purchase of goods and services.⁶⁸⁰ Since the UCTD was developed for the offline world, the EP commissioned a study⁶⁸¹ to examine if it is necessary to amend⁶⁸² the directive to improve consumer protection and to provide more legal certainty.

5.3.15. Further relevant directives

Depending on the intended use and design of Artificial Intelligence, further directives may be relevant, and their importance may not at all be apparent at first sight: owing to the fact that Artificial Intelligence nowadays is part of autonomous weapons systems, the Directive on Intra-EU Transfers of Defence-Related Products⁶⁸³ comes into play. Even the BioTech Directive⁶⁸⁴ will be relevant since Big Data and AI become more and more instrumental in Life Sciences,⁶⁸⁵ and few people may be aware of the fact

⁶⁷⁷ The European Commission provides background information on both, the Injunctions Directive and the Representative Actions Directive on their website, available at https://commission.europa.eu/law/law-topic/consumer-protection-law/injunctions-directive-and-representative-actions-directive_en#evaluation. that research has pushed so far as to store information and data in DNA: “DNA molecules can store up to 215 petabytes, or 215 million gigabytes, of data in a single doubled stranded molecule, making it one of the highest storage density mediums in the world (... which is much more) than we can currently create, so there has been a lot of focus in trying to harness the power and data storage capabilities of DNA for our (...) data storage systems.”⁶⁸⁶ The progress is such that at present, scientists are working on “Organoid Intelligence” (OI) by creating AI that uses real human cell brains.⁶⁸⁷ In the context of further relevant directives, the long-awaited⁶⁸⁸ ePrivacy regulation⁶⁸⁹ may be of importance⁶⁹⁰ as well because it would affect companies with new rules on electronic communications, direct marketing, nuisance calls, the use of cookies or metadata, and consent.⁶⁹¹ Latest developments point to important changes such as processing of data without consent to detect fraud, or to “protect users’ vital interests” in the context of monitoring for the spread of epidemics⁶⁹² - an example of tangible consequence for individuals’ privacy protections and choices. The proposed admissible further processing of pseudonymized metadata and device information may lead to uncertainty as criteria seem to be loosely defined,⁶⁹³ and that is why some privacy rights organizations question whether this draft may erode privacy protections that have been included in previous versions.⁶⁹⁴ In their press release⁶⁹⁵, the Council stresses their awareness regarding cookie consent fatigue, but cookies may not be the issue in the long

run: Google started testing Federated Learning of Cohorts (FLoC)⁶⁹⁶ to replace third-party cookies. Some commented that this technology is more harmful than cookies since it will “make your browser do the profiling (...) by boiling down your recent browsing activity into a behavioral label, and then sharing it with websites and advertisers.”⁶⁹⁷ On the occasion of the World Wide Web Consortium in early 2021, Google announced that it will not be introducing FLoC in the European Union for the time being.⁶⁹⁸ The fact that Google is omitting an area to which GDPR applies suggests that there is awareness of the potential implications, and that FLoC may indeed raise privacy concerns.⁶⁹⁹

5.3.16. Directives which are no longer in force but relevant

The following Directives are no longer in force, but they are useful to understand the developments, discussions, and the overall context:

5.3.16.1. Directive 95/46/EC of the European Parliament and of the Council of 24 October 1995 on the protection of individuals with regard to the processing of personal data and on the free movement of such data

In 1995, the European Data Protection Directive⁷⁰⁰ was created. It regulated the processing (including the collection, use, storage, disclosure, and destruction) of personal data within⁷⁰¹ the European Union. This directive was the first framework for data protection regulation at European Union level and an important component of the European Union’s data protection rights for more than two decades. The directive intended to harmonize data protection law across Europe.⁷⁰² Due to the fact that Member States must transpose directives into national law, this directive served as basis for numerous national data protection laws throughout the European Union. Differences in terms of content and timing of implementation of the requirements lead to somewhat differing levels of privacy protection even within

the European. This also resulted in cases of conflict between European and national law, especially when there were overlaps with other areas of law, for example competition laws, since data protection laws are not the only issue to address for marketing activities. As regards the processing of personal data, Article 6 (1) b of the Data Protection Directive stipulated that Member States shall provide that personal data must be “(...) collected for specified, explicit and legitimate purposes and not further processed in a way incompatible with those purposes. Further processing of data for historical, statistical, or scientific purposes shall not be considered as incompatible provided that Member States provide appropriate safeguards”. Rules on compatible processing of personal data including exceptions for statistical or scientific purposes are important for Big Data applications.

5.3.16.2. Directive 2006/24/EC of the European Parliament and of the Council of 15 March 2006 on the retention of data generated or processed in connection with the provision of publicly available electronic communications services or of public communications networks and amending Directive 2002/58/EC

The Data Retention Directive⁷⁰³ obliged electronic communication service providers to retain traffic and location data for a certain period. The directive was invalidated in 2014 in a cutting-edge decision: Even though it was recognized that the purpose of the directive genuinely satisfies an objective of general interest, the CJEU⁷⁰⁴ concluded that the directive was incompatible with Article 7 and 8 of the Charter. The reason for this was that, if traffic and location data are taken as a whole, this provides for a detailed picture of individuals’ private lives, and therefore constitutes a serious interference with fundamental rights to respect for private life and to the protection of personal data. In another case,⁷⁰⁵ the CJEU found that the generalized retention of traffic and location data may affect the use of electronic communication and how users’ exercise their freedom of expression guaranteed in Article 11 of the Charter. Even though this directive is no longer in force, it cannot be disregarded as the CJEU’s decision may well serve as an indicator when it comes to judging storage periods.⁷⁰⁶ Moreover, the battle for the retention (use) of traffic and location data of telecommunications is not over: several Member States are putting pressure on the European Council to adopt rules that allow for the retention of metadata of communications; their ideas are far-reaching and could change existing data protection rules.⁷⁰⁷ Some Member States made it

⁷⁰³ The text of the Data Retention Directive is available at <https://eur-lex.europa.eu/LexUriServ/LexUriServ.do?uri=OJ:L:2006:105:0054:0063:EN:PDF>.

to advocate for the introduction of provision allowing for data retention measures in the Council version of the ePrivacy Regulation.⁷⁰⁸ In this regard, it is important to note that various national constitutional courts⁷⁰⁹ as well as the European Court of Justice continue with decisions that limit data retention measures.⁷¹⁰

5.4. General Data Protection Regulation

It is impossible to examine the existing legal framework for Big Data and Artificial Intelligence from a data protection perspective without having a look at the core of EU's data protection regulation, the GDPR: the General Data Protection Regulation is a milestone in privacy regulation⁷¹¹ and has served as a role model for many other data protection laws.⁷¹² GDPR sets forth important principles like accountability, lawfulness, fairness and transparency, purpose and storage limitation, data minimization, accuracy as well as integrity and confidentiality⁷¹³ and introduced novelties like the right to data portability or obligatory report of data breaches.⁷¹⁴ However, GDPR also poses challenges, be it because of its extra-territorial scope and new sanctions, or because of new requirements, and indeterminate legal terms.

5.4.1. Scope

The Data Protection Directive's territorial scope comprised Member States and non-EU members which are a part of the European Economic Area.⁷¹⁵ In comparison to the Data Protection Directive, the scope of the GDPR was expanded: the extra-territoriality principle is one of the biggest changes,⁷¹⁶ for good reason: personal data is collected and shared globally, and therefore, inconsistent (national) data protection laws are neither appropriate nor timely.⁷¹⁷ GDPR captures much more overseas organizations, because it does not only apply to organizations which are established within the European Union: according to GDPR Article 3 (1), the "Regulation applies to the processing of personal data in the context of the activities of an establishment of a controller or a processor in the Union, regardless of whether the processing takes place in the Union or not". Recital 22 says that an "establishment implies the effective and real exercise of activity through stable arrangements" and clarifies that "the legal form of such arrangements (...) is not the determining factor". This leads to the result that there is a wide spectrum of what might be captured by the GDPR; depending on the circumstances, perhaps even single individual sales representatives may fall under the Regulation. In 2014, the CJEU ruled that that Google Inc. with EU based sales and advertising operations in Spain was established within the EU.⁷¹⁸ The court delivered another landmark ruling in 2015 in the so-called Weltimmo-case. The court considered the meaning of establishment and concluded that, because Weltimmo pursued real and effective activity in Hungary, it had an establishment in Hungary and is therefore subject to Hungarian data protection laws, even if Weltimmo is a Slovakian property website.⁷¹⁹ Weltimmo was thus subject to both, Hungarian and Slovakian data protection laws, i.e., the data protection of its home country. This decision dates to 2015 when GDPR was not valid yet, and it is interesting insofar as the Regulation envisages that companies will only have to deal with one single DPA,⁷²⁰ typically the supervisory authority in the member state in which the company has its EU headquarters. What is more important, GDPR may also be applicable⁷²¹ when the company has no establishment within the European Union. An organization

Article published January 5, 2023, available at <https://www.insideprivacy.com/eu-data->

is still caught by the Regulation if it processes personal data of data subjects who are in the Union and where the processing activities are related to “the offering of goods or services, irrespective of whether a payment of the data subject is required, to such data subjects in the Union; or the monitoring of their behavior as far as their behavior takes place within the Union”.⁷²² Internet use profiling (Recital 24) is expressly referred to as an example of monitoring. Recital 24 underlines that the latter example refers to processors not established in the Union “if data subjects within the Union are profiled”. The Regulation thus shifts its focus to the country of destination, and especially Recital 24 shows that, even though there is no single specific article on marketing, GDPR indeed targets the advertising industry if profiling and online tracking techniques are used. This approach is consequent as it means that companies who want to benefit from the European market will have to stick to EU rules. Finally, in order to allow for supervisory authorities to communicate with companies established outside the EU, the Regulation stipulates that a representative must be appointed.⁷²³ Companies may not be able to escape or avoid GDPR’s extra-territorial approach, but It remains to be seen whether companies will be able to forum shop by assigning their representative in a country where the supervisory authority is known to be rather tolerant as GDPR Article 27 (3) allows that the “representative is established in one of the Member States where the data subjects whose personal data are processed in relation to the offering of goods or services to them, or whose behavior is monitored, are.” The Directive focused on those who determined purposes and means of the processing, and this way, it primarily addressed controllers. Under the Directive, processors were subject to obligations which were imposed on them through contractual relationships with data controllers. This became particularly evident in the case of “processing chains” when the general contractor had to ensure that all other suppliers who act as data processors observe the contractual regulations laid down by the controller. In contrast, GDPR imposes direct obligations on data processors, i.e., entities and suppliers which are engaged by a controller to process personal data on their behalf. Under the GDPR, processors are required to obey numerous specific obligations, for example the maintenance of records of processing activities,⁷²⁴ performance of impact assessments,⁷²⁵ the implementation of appropriate security standards,⁷²⁶ the appointment of a Data Protection Officer, if need be,⁷²⁷ and the obligation to cooperate with supervisory authorities.⁷²⁸ Just like controllers, processors may be liable to sanctions if they fail to meet these requirements and they may also face claims for compensation. Moreover, GDPR changed the definition of personal data to reflect technological changes and the way that personal information is used: comparatively, under the Data Protection Directive, personal data was defined as data such as names, photos, email addresses,

phone numbers, addresses, and personal identifiers like social security numbers; under the GDPR, personal data is defined as any information that could be used, on its own or in conjunction with other data, to identify an individual.⁷²⁹ Despite these differences, it is important to underline the continuity between the Data Protection Directive and the General Data Protection Regulation as many general data protection principles like the accountability, use limitation and purpose specification or the security safeguards principle which are also common to other privacy frameworks⁷³⁰ are maintained and / or enhanced.

5.4.2. Sanctions

5.4.2.1. Administrative fines

An important change under the Regulation is that businesses, in the event that they fail to comply with GDPR requirements, may be liable to pay fines of up to four percent of the annual worldwide turnover or 20 million Euros, whichever is higher.⁷³¹ In comparison to the previous legal setting under the Directive and national legislations,⁷³² this is a substantial increase in the maximum possible fine, especially given the fact that such fines are not calculated on the basis of a local entities' turnover.⁷³³ The term undertaking is defined in GDPR Article 4 (19), and Recital 150 says that undertaking shall be understood "to be an undertaking in accordance with Articles 101 and 102 TFEU for those purposes". Even though the TFEU does not define the term undertaking and despite of the fact that, like in every legal field, extensive case law must be considered, it may be assumed that a group of companies shall be regarded as part of the same undertaking; the concept of an undertaking encompasses every entity that engages in economic activities regardless of its legal status or how the entity is financed. Fines will therefore not be imposed by reference to the individual controller or processor, but by revenue of an undertaking, and GDPR this way follows the broad definition of undertaking in anti-trust and anti-bribery laws. This conceptual change represents a high impact for businesses and may thus lead to data protection being taken seriously in terms of compliance risk. This is especially true for multinational businesses as group revenues will be taken into consideration when calculating fines. This is underlined

by the fact that national data protection supervisory bodies will be coordinating their work across EU Member States, which will likely lead to a more pronounced enforcement, especially in an international context as the so-called “one-stop-shop” principle⁷³⁴ shows: Even though this principle only applies to cross-border cases where the supervisory authority (SA) of the main establishment of the controller or processor will be competent to act as the lead SA and serve as a “one-stop-shop” to supervise all processing activities of that business, this mechanism is a perfect example of a cooperation procedure between several supervisory authorities and will thus ensure the desired consistency in law enforcement in the area of data protection. Various national SAs will have to ensure⁷³⁵ the demand that administrative sanctions are effective, proportionate, and dissuasive,⁷³⁶ which of course depends on the case in question. There has been a trend towards more drastic fines, and European data protection supervisory authorities announced the following penalties for GDPR violations:⁷³⁷ TikTok: € 5 million,⁷³⁸ Apple: € 8 million,⁷³⁹ Vodafone: € 12 million,⁷⁴⁰ Marriott: £ 18 million,⁷⁴¹ Google: € 50 million,⁷⁴² WhatsApp: € 225 million,⁷⁴³ or Microsoft with € 60 million⁷⁴⁴ and Meta with € 390⁷⁴⁵ million and € 725 million,⁷⁴⁶

Amazon holds the record for one of the highest penalties ever imposed to date with € 746 million.⁷⁴⁷ However, sanctions and fines under GDPR, member-state data privacy and administrative as well as business criminal law are not the same: certain Member States do not foresee for fines⁷⁴⁸, other laws foresee that there must be a link to linked to a concrete, reproachable act of a natural person, which is not the same as the (group of) undertaking.⁷⁴⁹ In addition, several cases have shown that regulator fines under GDPR may be contested⁷⁵⁰, for a variety of reasons,⁷⁵¹ meaning that it is perhaps not as easy as envisaged to successfully issue penalties for GDPR violations. National data protection supervisory authorities came up with their own fine calculation models⁷⁵² to help standardize how fines are calculated. Most importantly, the European Data Protection Board published guidelines on the calculation of administrative fines under the GDPR⁷⁵³ to ensure data protection authorities use the same methodology for the calculation of fines. It is believed that this shall help with the harmonization and transparency of the fining practice of DPAs.⁷⁵⁴

5.4.2.2. Enforcement powers

Apart from administrative fines, supervisory authorities are provided with wide-ranging powers⁷⁵⁵ to enforce compliance with the Regulation, for example the right to issue warnings, to perform audits, the power to compel a controller or processor to provide any information which is relevant to the

⁷⁵⁵ See GDPR Article 58 (1 a).

performance of supervisory authority's duties as well as the possibility to impose a ban on processing.⁷⁵⁶ Given the large number of conceivable infringements, which must always be assessed individually, it is difficult to tell how different supervisory authorities will implement their enforcement powers. Even though the GDPR has not been in force for long, the multitude of regulators that govern the use of personal information, the processing with the help of AI, including further bodies like the FTC or supervisory authorities in charge of competition law or consumer protection – set aside legal proceedings for claims for damages – shows that overlapping responsibilities could be problematic.

5.4.2.3. Representation of data subjects

On top of GDPR's administrative sanctions, the Regulation also allows for non-for-profit bodies, organizations or associations which are active in the field of the protection of data subjects' rights and freedoms with regard to the protection of their personal data and which disposes of statutory objectives that are in the public interest to lodge a complaint on behalf of the data subject and to exercise data subjects' rights including the right to receive compensation.⁷⁵⁷ It is moreover necessary that such an association has been properly constituted in accordance with the law of a member state, meaning that not each and every NGO has the right to represent data subjects. Although this is not the same as a U.S. style class action, this novelty increases the risk of group privacy claims, and this type of actions leads to further pressure to observe the new rules as business typically fear potential negative consequences for public opinion. Another fact to consider is emerging legal tech: the number of providers who are offering assistance for individuals to exercise their data subject rights is growing,⁷⁵⁸ and this poses further challenges, for example, in identification and valid representation of the individuals behind those claims.

5.4.2.4. Claims by individuals

Claims under competition law by competitors and contractual claims by business partners are not at all a new phenomenon; these risks are part of business life, but what is new is that GDPR makes it considerably easier for individuals to bring private claims against data controllers or processors: GDPR Article 81 (1) states that “any person who has suffered material or non-material damage as a result of an infringement of this Regulation shall have the right to receive compensation from the controller or processor for the damage suffered”. The inclusion of non-material damage means that claims of

⁷⁵⁶ See GDPR Article 58 (1 f). This shall be considered during the introduction of new tools, especially when there is a need to exchange with the works council for corresponding agreements.

⁷⁵⁷ See GDPR Article 80.

⁷⁵⁸ For both, data subjects and controllers, the market for DSAR automation is growing. It is estimated that already now, the industry has a three digit number of specialist vendors, see Datagrail background information provided at their website, available at <https://www.datagrail.io/blog/product/gartner-subject-rights-requests-2021/>. Retrieved October 24, 2021.

individuals are not limited to financial loss; even distress may justify a claim under GDPR Article 81. Recent developments show that there seems to be a trend to use data subject rights under GDPR to enforce other claims, namely in the context of severance claims in termination actions under labor law, which some consequently name as the “golden handshake”.⁷⁵⁹

5.4.3. GDPR’s goals

5.4.3.1. Broad applicability

GDPR’s broad applicability is not only due to the broader material and territorial scope, it is also based on the fact that the Regulation has a broader definition of personal data. Personally identifiable information such as online identifiers is explicitly included, and it is important to note that Recital 26 not only sets a low bar for the prerequisite “identifiable”, but it also makes clear that personal data can be given despite the fact that the organization which holds the data cannot itself identify a natural person: the only requirement is that, if anyone can identify a natural person using all means reasonably likely to be used, the relevant data may be considered personal data.⁷⁶⁰ Businesses are often not aware that, even though they might not be able to read a set of data, the same set of data is subject to data protection law. The effect of broader applicability also applies to special categories of data whose definition was also broadened in GDPR Article 9 as genetic and biometric data were expressly included. While a few decades ago, for example iris-scans were only used in movies, today, every modern smartphone can be unlocked by using a fingerprint. The increase in technical applications with security features which process biometric data has led to a proportional increase in the applicability of data protection law – with all data protection, security law and sector-specific consequences. Another point to consider is that the volume of data that is being produced rises at an incredible rate, because people dispose of more devices that generate more data, which again leads to a broader applicability of data protection laws.⁷⁶¹

⁷⁵⁹ Niko Härtling: Mit der DSGVO zum “Golden Handshake” – von der Sprengkraft des “Rechts auf Kopie”. Article published March 29 2019, available at <https://www.cr-online.de/blog/2019/03/29/mit-der-dsgvo-zum-golden-handshake-von-der-sprengkraft-des-rechts-auf-kopie/>. Retrieved October 24, 2021.

⁷⁶⁰ GDPR Recital 26, sentence 3 and 4: “To determine whether a natural person is identifiable, account should be taken of all the means reasonably likely to be used, such as singling out, either by the controller or by another person to identify the natural person directly or indirectly. To ascertain whether means are reasonably likely to be used to identify the natural person, account should be taken of all objective factors, such as the costs of and the amount of time required for identification, taking into consideration the available technology at the time of the processing and technological developments”.

⁷⁶¹ GDPR itself explains the development in Recital 6: “Rapid technological developments and globalization have brought new challenges for the protection of personal data. The scale of the collection and sharing of personal data has increased significantly. Technology allows both private companies and public authorities to make use of personal data on an unprecedented scale in order to pursue their activities. Natural persons increasingly make personal information available publicly and globally. Technology has transformed both the economy and social life.”

5.4.3.2. Uniform applicability

GDPR's broad applicability must be distinguished from the intended uniform applicability of the Regulation: GDPR clearly aims at ensuring a consistent and high level of protection of the rights and freedoms of natural persons with regards to the processing of their data,⁷⁶² and that can only be achieved if that level is equivalent in all Member States. Even though a consistent and homogenous application of data protection laws is desired throughout the European Union, GDPR Article 23 clearly says that member state law may restrict "by way of a legislative measure the scope of the obligations and rights provided for in Articles 12 to 22 and Article 34, as well as Article 5 in so far as its provisions correspond to the rights and obligations provided for in Articles 12 to 22, when such a restriction respects the essence of the fundamental rights and freedoms and is a necessary and proportionate measure in a democratic society to safeguard national security, defense, (...)". This is just one example out of dozens of exceptions⁷⁶³ for the regulatory scope of national legislators. It can therefore be said that the intended harmonization is relative insofar as many important issues and areas of law continue to be governed by national laws. Moreover, chapter IX of GDPR sets out various processing operations which include additional derogations and exemptions⁷⁶⁴ such as processing and freedom of expression and information, processing and public access to official documents, processing of national identification numbers and processing in the context of employment.

5.4.3.3. Focus on accountability

Many of the principles laid down in GDPR Article 5 were also incorporated in the Data Protection Directive, for example the principle of purpose limitation or the principle of data minimization: Article 6 of the Directive stipulated that "personal data must be: (a) processed fairly and lawfully; (b) collected for specified, explicit and legitimate purposes and not further processed in a way incompatible with those purposes. (...) (c) adequate, relevant, and not excessive in relation to the purposes for which they are collected and / or further processed (...)" and concluded with the statement in paragraph 2 that "it shall be for the controller to ensure that paragraph 1 is complied with". In contrast, Article 5 (2) of the Regulation requires that the controller is responsible for and must be able to demonstrate compliance with all data protection principles. The difference is that, even though most of the standards existed before, the focus on accountability requires that the lawfulness of processing activities is established, meaning that there is a burden of proof obligation that business operations are compliant with the

⁷⁶² GDPR Recital 10.

⁷⁶³ Lukas Feiler provides an overview over the topic in his presentation: Die 69 Öffnungsklauseln der DSGVO. Presentation held on behalf of the law firm of Baker & McKenzie/Diwok Hermann Petsche Rechtsanwälte LLP & Co KG in Vienna during the meeting of JusIT on June 1, 2017, available at http://www.lukasfeiler.com/presentations/Feiler_Die_69_Oeffnungsklauseln_der%20DS-GVO.pdf. Retrieved October 24, 2021.

⁷⁶⁴ See GDPR Articles 85, 86, 87 and 88.

Regulation. And the relief some expected due to, for example, the law not insisting on written format for consent, is not given as consent must be verifiable, meaning that the controller must obey documentation requirements. And there are numerous further documentation requirements, for example, for legitimate interest assessments,⁷⁶⁵ the collection and processing of special category data,⁷⁶⁶ or age verification,⁷⁶⁷ to name a few. The accountability principle has become a core element of data protection in many other jurisdictions, for example Australia, Canada, or Singapore.⁷⁶⁸ Accountability leads to greater efforts with regards to the documentation of processes, the performance of controls, the conclusion of (outsourcing) contracts, and the overall legality of decisions including providing proof of legal grounds for processing which allow controllers to be able to demonstrate compliance. The accountability principle primarily manifests itself in documentation obligations, namely records of processing activities⁷⁶⁹ and the performance of data protection impact assessments.⁷⁷⁰ While the latter only applies to high risk processing, records of processing activities have to be present for every single data processing activity the controller carries out.⁷⁷¹ Provided that Big Data and AI applications may pose high risks to the rights and freedoms of individuals, it is likely that many such processing activities will result in the creation of impact assessments, particularly when profiling is in question, when sensitive personal data are processed or when publicly accessible areas are systematically monitored on a large scale.⁷⁷² Other mandatory requirements include the implementation of Privacy by Design and Privacy by Default,⁷⁷³ the establishment of mechanisms for data breaches⁷⁷⁴ and responses to data subject requests.⁷⁷⁵ The designation of a Data Protection Officer is necessary, either when certain conditions are met or when Union or Member State requires that a DPO is appointed.⁷⁷⁶ This is yet another example of how the situation will continue to vary from one Member State to another, even with mandatory requirements. Data controllers may, on a voluntary basis, also opt for certification

⁷⁶⁵ See GDPR Article 6 (1) lit. f.

⁷⁶⁶ See GDPR Article 9.

⁷⁶⁷ GDPR Article 8 (1).

⁷⁶⁸ The law firm Hunton Andrews Kurth refers to the results of the 2018 intelligence gathering operation on organizations' data privacy accountability practices which was carried out by GPEN, a global network of more than 60 DPAs around the world. ⁷⁶⁹ See GDPR Article 30.

⁷⁷⁰ See GDPR Article 35.

⁷⁷¹ The issue was solved inconsistently in previous data protection laws within the EU; in some jurisdictions (for example in Austria), there was a requirement to notify the national data protection authority of data processing operations. In others, e.g., in Germany, this requirement was not applied as a general rule as the controller was obliged to maintain the relevant documentation and to provide it to the DPO for checking purposes (see § 4 e, g of the pre-GDPR-BDSG). Under GDPR, there is a general necessity to keep extensive internal records of data protection activities.

⁷⁷² See Recital 91 which provides background information and examples for data protection impact assessments.

mechanisms to demonstrate compliance.⁷⁷⁷ Some criticize voluntary or self-regulation because might be an escape from regulation,⁷⁷⁸ and that is why it makes sense to explore the existing legal framework that already provides for joint controllership, accuracy, or accountability. But the question is whether accountability as set forth in existing data privacy laws goes far enough to guarantee responsibility, liability, contestability, safety, and fairness together with an approach to data processing that includes sound risk assessment and human oversight and human intervention if need be. Another problem with the application of existing legal principles of data protection is that there is a risk of trade-offs between different data protection principles: more data may lead to more accuracy, but at the expense of individual's privacy; if AI is tailored to avoid discrimination, i.e., if certain indicators are removed to that AI is fair, this may have an impact on accuracy.

5.4.3.4. Enhanced transparency

Transparency is a central principle in the GDPR because it promotes the objective of strengthening individuals' rights and underlines the importance of the lawfulness of processing personal information. Processing is only lawful if it is fair and transparent, and that is why any communication towards data subjects must be concise, transparent, intelligible and easily accessible, and use clear and plain language.⁷⁷⁹ In connection with transparency requirements, one is immediately tempted to think about one specific use case: privacy notices on website that must be provided at the time data is collected.⁷⁸⁰ But much of the content that is displayed as mandatory information on websites in fact is not solely based on data protection law. For example, neither the imprint nor terms and conditions or payment information is a genuine data protection issue; this is rather about consumer protection and provider identification, in some cases extended with information on the competent regulatory authority.⁷⁸¹ A positive development could be that GDPR's requirements might have already changed users' perceptions since information obligations apply in many scenarios: on websites, in apps, during the application process, etc. But at the same time, a negative consequence is that this may lead to users being overwhelmed with information which in turn leads to information fatigue.⁷⁸² Transparency requirements

Retrieved September 25, 2021.

are sometimes difficult to implement,⁷⁸³ and more importantly, they are limited even when automated decision-making including profiling is in question because controllers are not required to provide all kinds of information,⁷⁸⁴ not to mention protected business information. Trade secrets are only one reason for limitations, general information asymmetries⁷⁸⁵ are another aspect to consider, and the information mismatch goes hand in hand with the imbalance of powers between the parties and adds to dilemma data subjects face. The GDPR made a genuine effort to better inform individuals, but the Regulation also removed the need to register with supervisory authorities and notify them for certain endeavors,⁷⁸⁶ which shows that GDPR is predominantly concerned with transparency towards affected individuals. While it must be recognized that transparency truly is an elusive goal because it is difficult to explain processing operations and / or decisions made by a multitude of algorithms that work together, transparency is decisive from the individual's perspective, but in many instances, information obligations are fulfilled in a legalistic manner. But they could be further developed in the direction of comprehensive and meaningful, repetitive⁷⁸⁷ and public⁷⁸⁸ information to allow for explainability that addresses not only affected individuals, but a wider audience, for example, by establishing public databases for high-risk processing operations allowing any interested party to access relevant information such as details on risk evaluations, mitigation measures and information on sub-processors since various service providers may be involved in data processing. AI's potential for opaqueness and its ability to act in unforeseeable ways adds to the fear that certain types of AI systems may leave data subjects with insufficient information about how their data is treated. That is why some think about the introduction of labeling obligations or mandatory watermarks for AI generated content,⁷⁸⁹ and others stress the necessity to concretize transparency obligations to the effect that information must be provided

⁷⁸³ For example, in the case of CCTV or when buying a personalized train ticket when the journey has already begun. There are numerous scenarios in which full transparency about the data processing is only feasible with the help of a multi-step approach. Background information on the so-called layered approach in the context of transparency obligations is provided by the ICO, available at <https://ico.org.uk/for-organisations/guide-to-data-protection/guide-to-the-general-data-protection-regulation-gdpr/the-right-to-be-informed/what-methods-can-we-use-to-provide-privacy-information/#how2>. on the scope and actual effects, not only basics on the underlying logic, and not only when there are significant legal implications, but in any profiling scenario.⁷⁹⁰

5.4.3.5. Strengthening of data subject rights

Data subject rights have been extended: the right to information and the right to access existed before, but the right to data portability and the explicit right to be forgotten are genuine novelties. Subject access rights must be answered during a certain period of time,⁷⁹¹ and given that the maximum period to answer such requests is three months, that sounds feasible, but the scope of this data subject right poses challenges,⁷⁹² especially when raised in combination with claims for damages in the context of termination actions under labor law. Practical problems also arise out of the right to request information or a copy of personal data by electronic means:⁷⁹³ first, the controller has to make sure that he is answering to the correct person, i.e., the data subject whose data are in question; second, answering by electronic means must not mean that a simple e-mail can be used for communicating with the data subject unless encryption is used. This would necessarily lead to a violation of GDPR Article 32, security of processing. That means that something as simple as a demand by email necessarily leads to additional processes, primarily the identification of the individual.⁷⁹⁴ This is the mandatory first step businesses need to think about, and depending on their business model (B2B or B2C) and the number of incoming requests, it is conceivable that data subject rights are resolved e.g. by the implementation (further customization) of a customer portal⁷⁹⁵ including relevant log-in data in order to verify and ensure that the right person requests the right information. Such a self-service would also be valuable for other data subject rights, for example the right to copy of their data. At present, the relationship between the right to information about personal data and the right to a copy of personal data is unclear; guidance at national or local authority level⁷⁹⁶ is not always helpful as not all SAs explain the scope and relationship between

⁷⁹⁰ Alexander Roßnagel, Christian Geminn: Evaluation der Datenschutz-Grundverordnung aus Verbrauchersicht. Gutachten im Auftrag des Verbraucherzentrale Bundesverbands e.V. Report published November 26 2019, available at <https://www.heise.de/downloads/18/2/8/0/2/5/0/7/vzbv.pdf>. Retrieved October 20, 2021.

⁷⁹¹ As a basic rule, such requests shall be answered within one month; this period may be extended by two further months where necessary, e.g., in the event that the request is of complex nature: see GDPR Article 12 (3).

⁷⁹² For example, because it was questionable whether data subject must be informed about recipients. The European Court of Justice ruled that the controller must provide the actual identity of recipients, unless it is impossible to identify them or the data subject's requests are manifestly unfounded or excessive: Curia Case C-154/21, available at <https://curia.europa.eu/juris/liste.jsf?language=en&num=C-154/21>. Retrieved January 10, 2023.

⁷⁹³ See GDPR Article 12 (3).

⁷⁹⁴ The State Commissioner for Data Protection and Data Security in the German state of Baden-Württemberg dealt with this neglected topic. Their findings are available in the corresponding press release published February 6, 2019, available at <https://www.baden-wuerttemberg.datenschutz.de/identitaetspruefung-bei-elektronischen-auskunftersuchen-nach-art-15-ds-gvo/>. Retrieved October 24, 2021.

⁷⁹⁵ Recital 63 deals with the issue of providing data subjects with remote access to their data.

⁷⁹⁶ Some countries have more than just one regulator in charge of data protection, for example, Germany. A list of local German SAs is provided by the federal German Information Commissioner, available at <https://www.bfdi.bund.de/DE/Service/Anschriften/Laender/Laender-node.html>. A list of European national data

those rights,⁷⁹⁷ however, the situation became clearer since the EDPB dealt with the matter.⁷⁹⁸ Some local data protection authorities seem to suggest that a copy could be considered the format of the right for information or equal to the right to access,⁷⁹⁹ others quote Recital 63 and argue that the scope of the right to a copy is limited by trade secrets or intellectual property rights and / or rights and freedoms of others.⁸⁰⁰ Others think about the possibility that data subjects shall be provided with an “overview” over their data as a simplified first step of information rather than enabling them to access all data the controller holds about them.⁸⁰¹ The right to access should be interpreted broadly as the opposite would lead to a limitation of data subject rights, especially as information is the basis for many other initiatives data subjects might want to take. But Recital 63 says that, if the “controller processes a large quantity of information concerning the data subject, the controller should be able to request that, before the information is delivered, the data subject specifies the information or processing activities to which the request relates”. Moreover, the European Court of Justice ruled⁸⁰² that the right to access shall not be interpreted in a manner that allows data subjects to request full duplicates of datasets, but that it is sufficient to provide the information in the form of an overview of the stored data. Even though the decision dates back to 2014 and thus refers to the Directive, it may still be considered applicable as the rationale the ECJ quoted remained the same in the Regulation, i.e. to enable the data subject to obtain knowledge of their data and to verify that it is accurate and processed in accordance with applicable laws with the goal to put the data subject in a position to examine further rights if need be. The aforementioned challenges with identification and secure transmission of information may lead to manual process which may result in data being provided on a mobile storage device and sent to a postal address at which a person is officially registered as this is the address a controller can legally rely upon. This is ironic insofar as the legislator intended to enhance data subject rights and to facilitate a smooth and easy way of communication and exchange. Not only does this problem not fit in the digital age; the solutions

Retrieved October 24, 2021.

that have so far been presented for identification purposes⁸⁰³ (and for avoidance of mistakes, i.e., data breaches) all have in common that they are in potential conflict with the principle of data minimization, because they all require even more information. Most potential solutions suggest that applicants provide further information and / or a copy of their ID card or that they undergo a postal or video identification process.⁸⁰⁴ Apart from the fact that it is not possible to connect ID card information to an e-mail address, which may vary, which may be replaced in the course of time, any such proposals lead to additional problems, for example duration and safety of storage of ID documents. This way, average companies might face further challenges like the avoidance of identity theft as one simple access request might lead to a full set of personal including ID data being stored in systems which are not tailored to meet the needs of handling such sensitive data (technical security measures, authorization concept, retention periods, etc.). If the data subject by mistake contacted the wrong controller, then his request is the initial ignition for a full set of data including sensitive information like national identification numbers (which might be subject to national legislation according to GDPR Article 87) being collected and stored. If one is seriously thinking of postal or video-identification-processes for identification purposes, this means that data subjects would have to put up with a great deal of effort, only because they want to exercise their rights. In addition, video-identification-processes involve biometric data (voice, iris), and that leads to further problems as special categories of data enjoy special protection in accordance with GDPR Article 9 (1), and as a basic rule, must not be processed – unless, for example, the data subject explicitly and voluntarily consented. As a result, even more data is collected (time, date, signature) and documentation (evidence) is produced. As a matter of fact, this procedure can only represent one solution, because if the data subject does not consent, then an alternative must be provided as the proper execution of data subject rights is mandatory. In summary, the overall effort and implications of data subject requests shall not be underestimated, particularly because data subjects enjoy additional rights on top of the right to access information, for example the right to restrict processing of their personal data in defined circumstances⁸⁰⁵ where the accuracy of the data is contested or where the processing is believed to be unlawful. Individuals may also require that their data is rectified⁸⁰⁶ if it is inaccurate or incomplete, or that their data is deleted, the so-called right to be forgotten,⁸⁰⁷ which now has its own article in the Regulation. The forerunner of this right was CJEU’s decision in which the court ruled that Google had to remove search results relating to historic proceedings against a Spanish national for an unpaid debt on the basis that Google as a data controller of the search results had no legal basis to process that information.⁸⁰⁸ However, the right to be forgotten as any other right has limitations, typically the

⁸⁰³ This text only uses the term identification, although to identification and authentication are meant.

⁸⁰⁴ The State Commissioner for Data Protection and Data Security in Baden-Württemberg summarized possible solutions and evaluated them their February 6, 2019 press release which is available at <https://www.baden-wuerttemberg.datenschutz.de/identitaetspruefung-bei-elektronischen-auskunftersuchen-nach-art-15-ds-gvo/>. ⁸⁰⁷ In accordance with GDPR Article 17.

⁸⁰⁸ The judgment of the court in case C-131/12 dated May 13 2014 is available at

rights of others, and that applies especially to the field of media as the right to be forgotten must not lead to censorship as freedom of expression must be respected.⁸⁰⁹ In in everyday business life, requests for deletion may quite often fail as controllers have to obey statutory retention periods, meaning that they have legitimate grounds to continue to process/store the data. As a result, the right to be forgotten only applies in rather a narrow set of circumstances, notably where the controller has no legal ground for processing the information. The right to data portability is new and has no equivalent in the Data Protection Directive. It is based on the idea that data subjects should be able to obtain their data in a structured, commonly used and machine-readable format,⁸¹⁰ including the right to transmit those data to another controller without hindrance.⁸¹¹ Recital 68 clarifies that the data subject's right to transmit or receive personal data concerning him or her should not create an obligation for the controllers to adopt or maintain processing systems which are technically compatible. This clarification is important as there was a fear that this new right would result in businesses tailoring their (CRM, HR, etc.) systems to fulfill such requests in an automated (ad hoc) manner. In fact, the Regulation clearly says that such investments are not needed. Depending on the underlying business model it is however likely that certain providers will agree upon certain standards between each other, for example email and cloud service providers and social networks. A request for data portability does not mean that data the (first) controller holds shall (also) be deleted, nor does it mean that the right only exists when a customer or client finishes the (business) relationship; data subjects are free to request data portability at any time – but only if certain conditions are met: this right can only be exercised when the (automated) processing of personal data is justified on the basis of consent, or where processing is necessary for the performance of a contract. Recital 68 makes it clear that the right to data portability is not given when the processing of the personal data is necessary for compliance with a legal obligation to which the controller is subject or when the processing was carried out in public interest. Since there is hardly one dataset in real life to which the same legal grounds apply for each and every entry, in most of the cases where a data subject requests their data to be transmitted to either themselves or another recipient, the data set will have mixed legal grounds. For example, an application for a credit loan requires certain basic data such as full name and date of birth for identification purposes and (retrospective) salary information for credit rating purposes. This is the data the subject provides directly and voluntarily. Because the bank is obliged to perform a background check with regards to liquidity and the matching against sanction lists, further data are collected from other sources such as credit agencies. Then there is yet other data the bank must collect from all applicants like the tax and / or identification number. Depending on whether the credit applied for is received through a website, further data will be collected, and this is usually the moment when Big Data comes into play as user and device information are collected and evaluated. This data together

http://curia.europa.eu/juris/document/document_print.jsf?doclang=EN&text=&pageIndex=0&part=1&mode=DOC&docid=152065&occ=first&dir=&cid=667631. Retrieved October 24, 2021.

⁸⁰⁹ See GDPR Article 17 (3).

⁸¹⁰ This does not mean that data subjects can insist on a specific format as the Regulation only requires that data are provided in a structured and commonly used format that is machine-readable.

⁸¹¹ See GDPR Article 20 (1).

represents the dataset for the credit application, and includes various legal bases, for example data needed for the performance of a contract, data needed to fulfill a legal (compliance) obligation and data which can be used for legitimate purposes. Apart from the fact that one could already argue which pieces of information fall under the category of data needed for the performance of a contract, it is even more questionable whether consent is the right legal basis for certain (extended) background checks or if legitimate interests of the controller may apply, especially in the field of predictive analytics. As data portability only applies to those data which the data subjects provide themselves and which are based either on consent or if the processing was necessary for the performance of a contract to which the data subject is party, it seems problematic to customize the right set of information. One solution could be to downsize accordingly, another solution could be over-fulfillment in the sense of providing more information than needed. Companies may like to tend to provide more than necessary by law to avoid conflicts, however, the dataset must always be checked against collateral data and / or information which may be considered business secrets. In any event, data portability is a perfect example of how important it is to carefully select suitable legal grounds for processing as the right to portability is the “price for consent”; the right does not apply when data are processed on the basis of legitimate interests.⁸¹² As a result, consent is not always the best and easiest solution to place data processing on a legal basis,⁸¹³ especially because any processing based on consent alone needs to be stopped immediately once consent is withdrawn,⁸¹⁴ and that can happen any time without providing any reasons.⁸¹⁵

5.4.3.6. Setting the bar for lawful processing

From a data protection standpoint, one of the core questions is lawfulness. GDPR Article 6 provides for six lawful bases for processing, and the challenge already starts with the question whether these lawful bases may be deemed to be equivalent.⁸¹⁶ From a business perspective, a well-known problem is that companies as controllers fail to recognize that consent is neither the only nor the best legal grounds for the processing of personal data. Choosing the right legal grounds depends on the overall context, the underlying purposes of the processing and the existing relationship with the data subject.⁸¹⁷ This

⁸¹² But the “price” is balancing of interests.

⁸¹³ Nico Härting described this phenomenon as the “consent fetishism” as many businesses fail to recognize that consent is neither the only nor always the best legal grounds for data processing. He provided thoughts on this problem during his 2012 presentation in the framework of the annual DSRI academy summit (DSRI Herbstakademie) that was held September 12-15 2012. The presentation is available at <https://rsw.beck.de/cms/?toc=ZD.60&docid=338853>. Retrieved October 24, 2021.

⁸¹⁴ See GDPR Article 7 (3): The withdrawal does not affect the lawfulness of processing before its withdrawal.

⁸¹⁵ The difference between GDPR Article 7 (3) and GDPR Article 21 (1) is that freely given consent can be withdrawn at any time, for any reason - unlike the need to specify or explain “grounds relating to his or her particular situation” when processing is based on legitimate interests or is performed for a task carried out in the public interest. See GDPR Article 21 (1) in conjunction with GDPR Articles 6 (1) lit. e, f.

⁸¹⁶ ICO Guide to the General Data Protection Regulation, p. 49. Guide published 2018, available at <https://ico.org.uk/media/for-organisations/guide-to-the-general-data-protection-regulation-gdpr-1-0.pdf>. Retrieved October 24, 2021.

⁸¹⁷ This can lead to advantages, e.g., in the area of direct marketing.

structure and approach was already present in the Directive, but the Regulation places more emphasis on being accountable for and transparent about the relevant lawful basis for processing. For example, if a procedure is based on the controller's legitimate interests, the prerequisite for that is that any such legitimate interests are documented internally⁸¹⁸ and communicated externally.⁸¹⁹ Given the complex matter, transparency needs in the framework of Big Data and AI applications and automated individual decision-making could be considered a higher barrier for data processing as the controller has to ensure that data subjects are furnished with all relevant information in conjunction with GDPR Articles 6, 7 and 12 to 22 in order to put them in the position to realize how such a processing may (and will) affect him.⁸²⁰ If GDPR requirements in the context of lawfulness are taken seriously, it could be argued that the bar for processing of personal information changed with GDPR: despite the fact that the catalogue of data processing principles in GDPR Article 5 (1) is clear and comprehensible, what is often overlooked is that every legal basis for processing of personal data involves the evaluation of whether or not such processing is necessary.⁸²¹ Necessity must not be confused with the method chosen to operate a business in a particular way;⁸²² necessity is "a fundamental principle when assessing the restriction of fundamental rights, such as the right to the protection of personal data".⁸²³ Therefore, even if the principle of data minimization is only mentioned once in the text of the Regulation explicitly,⁸²⁴ Recital 39 further clarifies the principles of data processing and specifies that the processing of personal data should be limited to what is necessary for the purposes for which they are processed. The same idea is expressed in the principle of purpose limitation,⁸²⁵ and both principles are crucial topics in the framework of Big Data and AI applications as these applications mostly depend on large (growing) datasets and quite often also on changing (dynamic) purposes.⁸²⁶ The bar for lawful processing has several further manifestations. A simple example is that consent cannot be based on mere inactivity or

⁸¹⁸ See GDPR Article 6 lit f. which says that processing is only lawful if legitimate interests of a controller are not "overridden by the interests or fundamental rights and freedoms of the data subject which require protection of personal data (...)". This means that a balancing of interests has to take place and given that controllers are accountable to demonstrate compliance with the principles relating to the processing of personal data in accordance with GDPR Article 5 (2), they have to document that they obeyed the principle of lawfulness, fairness and transparency in accordance with GDPR Article 5 (1 a).

⁸¹⁹ Transparency needs in accordance with GDPR Articles 13 and 14.

⁸²⁰ Laurens Nauds: The right not to be subject to automated decision-making: the role of explicit consent. Article published August 2 2016, available at <https://www.law.kuleuven.be/citip/blog/the-right-not-to-be-subject-to-automated-decision-making-the-role-of-explicit-consent/>. Retrieved October 24, 2021.

⁸²¹ GDPR Article 6 (1) lit. b, c, d, e and f explicitly mention that processing has to be necessary; GDPR Article 6 (1 a) – processing on the basis of the individual's consent – does not mention this term. However, GDPR Article 7 (4) stipulates that, when "assessing whether consent is freely given, utmost account shall be taken of whether, inter alia, the performance of a contract, including the provision of a service, is conditional on consent to the processing of personal data that is not necessary for the performance of that contract".

⁸²² ICO: Guide to the General Data Protection Regulation, p. 53, available at <https://ico.org.uk/media/for-organisations/guide-to-the-general-data-protection-regulation-gdpr-1-0.pdf>. Retrieved October 24, 2021.

⁸²⁶ See GDPR Article 6 (4) sets forth the conditions of such processing.

acquiescence of the data subject because consent can only be provided by a statement or by a clear affirmative act.⁸²⁷ Even though there is no requirement to provide consent in a written format, Recital 42 says that the controller must be able to demonstrate that the data subject has given consent, and that leads to a burden of proof for the controller. However, if consent is to be given in the context of a written declaration which involves other matters, the request for consent must be presented in such a way that it makes it “clearly distinguishable from all other matters, in an intelligible and easily accessible form, using clear and plain language”.⁸²⁸ The latter shall not be underestimated for simple reasons like the length of terms.⁸²⁹ Consent must be informed and specific⁸³⁰ and the GDPR forces organizations to demonstrate that the data subject's consent has been freely given,⁸³¹ and this circumstance may serve as an argument that the GDPR concretized the bar for legal processing from a documentation and burden of proof perspective. In the context of valid consent, European supervisory authorities commented on the issue of cookies:⁸³² the problem with the practice of using cookies is that users are often not asked for consent in an appropriate manner as some providers tend to rely on the idea that pop-up windows are sufficient in order to create transparency about the manner in which cookies are used, or that consent is mandatory in order to proceed with accessing the content and using the services of the website.⁸³³ In March 2019, the Dutch SA published their opinion⁸³⁴ on so-called cookie-walls on websites. A cookie-wall has the effect that access to the website is only granted when consent to the placing of tracking cookies⁸³⁵ and similar technologies is given. The Dutch authority said that the (required) consent obtained in this way is not freely given, because individuals have no genuine and free choice as withholding consent has adverse consequences. The use of a cookie-walls results in a take-it-or-leave-it-approach, and this practice is not compliant with the GDPR. Consequently, the regulator recommend that websites shall offer a real choice for users to either accept or reject cookies, meaning that the website must remain accessible if tracking cookies are refused.⁸³⁶ The guidance of the Dutch supervisory

⁸²⁷ See GDPR Recital 32 explicitly mentions that inactivity cannot constitute consent.

authority is a remarkable decision after a much-disputed decision⁸³⁷ Austrian case⁸³⁸ in late 2018 in which a complaint about consent that was obtained through a cookie-wall was not freely given was rejected. Instead, it validated (paid) subscription models as a viable alternative to (ad) tracking. It is true that the freedom to contract principle applies to private parties, and therefore, it could be assumed that providers are not obliged to make their content available free of charge and they have the right to set certain conditions for allowing access to their website or other services. But it seems difficult to recognize free choice when the choice is reduced to personal data or money in return. Such an interpretation is open to challenge, because as a result, it reinforces business models on the basis service against data. In this context, regulators issued further guidance which is not only relevant for cookies, but also meaningful for international data transfers since they underline the inadmissibility of such transfers to the U.S.:⁸³⁹ in late 2021, the Austrian regulator held that that the use of Google Analytics by a local website provider led to transfers of personal data such as identifiers, IP address and browser parameters to Google LLC in the U.S., and that this is in violation of Chapter V of the GDPR, because “the SCCs concluded between the respondents do not offer an adequate level of protection, because Google LLC qualifies as "electronic communication service provider" under 50 U.S. Code § 1881(b)(4) and is subject to surveillance by U.S. intelligence services and because any additional safeguards which have been put into place in addition to where insufficient as they could not prevent U.S. intelligence services from accessing the data subject's personal data”.⁸⁴⁰ But there are not only remarkable decisions, but there are also remarkable penalties: the French regulator CNIL issued high fines for Google and Meta, because following investigations, the CNIL found that the websites facebook.com, google.fr and youtube.com do not make refusing cookies as easy as to accept them and thus fined Meta € 60 million and Google € 150 million and ordered them to comply within three months.⁸⁴¹ In Germany, the former BDSG⁸⁴² took a clear position by saying that the conclusion of a contract must not be made dependent

⁸³⁷ Background information on the case is provided by Christopher Jeffery: Dutch data protection guidance on the use of cookie walls. ⁸⁴² BDSG § 28 3b.

on the data subject's consent if access to equivalent contractual services is not (reasonably) possible without such consent.⁸⁴³ The law intended to stress that services must not be made dependent on consent for data which are not required for the execution of the specific service. But it is important to note that the prohibition of tying only applies if the person concerned cannot reasonably be expected / is unable to switch to another supplier – such a thought is foreign to the General Data Protection Regulation as there is no such criterion in GDPR Article 7 (4); the norm merely states that “when assessing whether consent is freely given, utmost account shall be taken of whether, inter alia, the performance of a contract, including the provision of a service, is conditional on consent to the processing of personal data that is not necessary for the performance of that contract”. This means that any such circumstance must be taken into consideration, but it does not mean that any such circumstance would automatically lead to invalid consent. Several courts in Germany held that consent must be obtained for certain cookies,⁸⁴⁴ and Germany introduced a new Telecommunications Telemedia Data Protection Act (TTDSG) applicable as of late 2021 which combines data protection provisions from the Telemedia Act (TMG) and the Telecommunications Act (TKG):⁸⁴⁵ according to the new law which came with a twelve year delay, consent would not be required in certain instances, and the law also allows for consent management services so that users to indicate whether, where and under which conditions they consent or refuse to the setting of cookies. As regards freely given consent, the problem is that even within the Regulation, the relevant Article and the corresponding Recital are not congruent: Recital 43 says that “consent is presumed not to be freely given if it does not allow separate consent to be given to different personal data processing operations despite it being appropriate in the individual case, or if the performance of a contract, including the provision of a service, is dependent on the consent despite such consent not being necessary for such performance.” GDPR Article 7 (4) and Recital 43 may thus lead to different results.⁸⁴⁶ Given that GDPR-Articles have priority over Recitals, some authors claim that the effectiveness of coupling has to be assessed on case-by-case.⁸⁴⁷ Others claim that consent is always freely given when the data subject is free to choose between providers.⁸⁴⁸ The much discussed ePrivacy Regulation may help answer the question whether making access to website content without direct monetary payment conditional to the consent of the end-user will (not?) be considered disproportionate: it seems that cookie-walls will not be prohibited as long as users are given an “equivalent offer” and that consent will be feasible through browser settings – and that users who consented to the use of cookies

⁸⁴³ A very similar provision is included in § 95 (5) of the German Telecommunications Act.

⁸⁴⁴ For example, the Frankfurt am Main County Court in a decision that was issued October 19 2021 (Az.: 3-06 O 24/21), and available at <https://openjur.de/u/2378854.html>.

will have to be periodically reminded of their choices.⁸⁴⁹ The trouble with obtaining valid consent might lead to a shift of legal basis: provided that the desired processing of personal data can be justified with legitimate interest, consent could become a phase-out model.⁸⁵⁰ Some authors therefore believe that the economy will have to start to base processing of personal data on legitimate interests, because consent as a legal instrument appears to be weakened.⁸⁵¹ This argument is reinforced by the fact that Recital 43 mentions another criterion as it stresses that consent is not valid if there is a clear imbalance between the data subject and the controller. This is very important in practice; a typical example of imbalances is the relationship between employer and employee.⁸⁵² The imbalance between processor and data subject was also criticized by the German Federal Cartel Office: the Cartel Office prohibited Meta from merging user data from various sources. The Cartel Office said that the data processing conditions for the use of Meta violate data protection law as set forth by the GDPR and that they constitute an abuse of Meta's dominant position in the market for social networks for private users.⁸⁵³ The result is that, as far as Germany is concerned, WhatsApp and Instagram may continue to collect data. However, in the future, data may only be assigned to a Meta user account with the user's consent. If such consent is not given, the data must remain with the other services and may not be processed in combination with Meta data. The same applies to the collection and assignment of data from third-party websites to the Meta user account, which will also only be possible in the future if the user voluntarily consents to the assignment to his or her Meta user account. While data protection practitioners may welcome this opinion as it is in favor of data subjects, the decision caused astonishment, because the German Federal Cartel Office felt competent⁸⁵⁴ to comment on a data protection matter. The Cartel Office moreover does not seem to see a conflict between the application of antitrust law and data protection law,⁸⁵⁵ since it attempted to establish its competence by examining data protection law within the framework of antitrust law. But this view seems contestable given that GDPR aims at a uniform

Retrieved October 24, 2021.

application of the Regulation, and that is why cooperation between supervisory authorities is foreseen.⁸⁵⁶ The opinions on the relationship between (freely given) consent and other legal bases also do not show a uniform picture: despite the fact that GDPR Article 6 (1) says that processing is lawful “if and to the extent that at least one of the following applies (...)”, therefore clearly saying that more than just one legal basis may be applicable for the case in question, it is disputed whether or not data processing may be based on several legal bases mentioned in GDPR Article 6. Some believe that consent may be used as a precautionary measure in the event that there is doubt which other legal bases may be applicable.⁸⁵⁷ This interpretation seems comprehensible, since a literal interpretation of GDPR Article 6 (1) does not suggest that a particular legal basis is favored or preferred, but that all the possibilities mentioned are equivalent.⁸⁵⁸ Consequently, some authors suggest that several legal grounds may be used as a legal basis for processing, while other authors believe that recourse on other legal grounds such as legitimate interests is not possible whenever consent was provided, especially if consent was revoked.⁸⁵⁹ The reason for this is that, if consent is obtained, this serves as an indicator that the data subject is in full control of the data processing, and that the use of any other legal basis shall be considered contradictory and therefore inadmissible.⁸⁶⁰ In this context, some also speak of the blocking effect which unfolds when consent is given.⁸⁶¹ This argument is rejected by others, because this way, consent would have a more important position than other legal provisions.⁸⁶² The situation is worsened by the fact that many businesses continue to “misuse” consent as an easy means of obtaining legal grounds, either not knowing or ignoring that, depending on the case, consent may not be needed and may therefore not be the appropriate legal basis: a typical example is that companies ask for consent even though the data processing for the service in question is covered by GDPR Article 6 (1) lit. b, the performance of a contract, which is regularly the case for many services which are rendered for customers.⁸⁶³ However, if companies base (part of) their data processing operations on the performance of a contract, such legal grounds must not be overused either: the EDPB adopted guidelines on the scope and application of

Retrieved October 24, 2021.

GDPR Article 6 (1b) in the context of information society services.⁸⁶⁴ The EDPB restricts the possibility for companies to base the processing of users' data on the legal basis fulfillment of contract. This view was welcomed, because it is argued that, if GDPR sets strict conditions for the permissibility of consent, it shall not be acceptable to bypass this requirement simply by including certain data processing operations in contracts (terms and conditions) that actually do not have much to do with the provision of their (online) services.⁸⁶⁵ Apart from these general rules for consent, special conditions apply to vulnerable groups⁸⁶⁶ like the consent of children,⁸⁶⁷ and special requirements also apply if consent is given in relation to sensitive personal data.⁸⁶⁸ On the one hand, it could be argued that GDPR's emphasis on accountability and documentation as well as principles like purpose specification indicate a strict bar for processing, but the other side of the medal is that GDPR acknowledges various privileges for certain purposes, and it also recognizes legitimate interests as a legal basis and allows for secondary use of personal information. Admissible use of personal data for secondary purposes is only feasible when certain conditions are met, but it still means that continuous data processing in principle is legally acknowledged. Since many AI applications include ADM, it is worthwhile to examine rules that apply to automated decision-making as this may indicate where to draw the line as regards legal basis in the sense of: what are scenarios in which either the law provides for limitations, or where the individual is afforded the power to prevent data processing, and based on which grounds? As regards legal conditions for ADM, it shall first be noted that under GDPR, only legal obligations, contract, and consent can justify qualifying ADM; the rest of the GDPR provisions applies to automated individual decision-making regardless of Article 22 conditions. What is more difficult to answer is the question whether automated processing may or may not include human involvement, and what qualifies as a decision with legal or similarly significant effects. To that end, a recent report⁸⁶⁹ examined publicly available judicial and administrative decisions and regulatory guidelines across EU / EEA jurisdictions and the UK to evaluate this issue based on more than 70 cases, i.e., court rulings, enforcement decisions, individual opinions or general guidance issued by national supervisory authorities and the European Data

⁸⁶⁴ Background information is provided in EDPB's Guidelines 2/2019 on the processing of personal data under Article 6 (1) lit. b GDPR in the context of the provision of online services to data subjects (version for public consultation) Guidelines adopted April 9 2019, available at https://edpb.europa.eu/sites/edpb/files/consultation/edpb_draft_guidelines-art_6-1-b-final_public_consultation_version_en.pdf. It is important to note that "all documents adopted during the EDPB Plenary are subject to the necessary legal, linguistic and formatting checks and will be made available on the EDPB website once these have been completed", see https://edpb.europa.eu/news/news/2019/ninth-plenary-session-guidelines-processing-personal-data-context-information-society_de. Protection Supervisor. The publication showed that ADM uses must be judged on a case by case basis, for example, “live facial recognition in schools was declared unlawful in several cases primarily because it did not have a valid lawful ground for processing in place; consent was considered to be the only ground that could justify the use of this technology to process personal data of students, and consent was not considered to be freely given in any of the cases analyzed that related to students and schools. On the contrary, relying on live facial recognition to ensure safety on a football stadium was considered lawful by a DPA even if it was not based on consent, but on substantial public interest, and provided that a set of safeguards was also ensured.”⁸⁷⁰ Owing to the fact that the body of case law grows, the criteria for assessing “solely automated decisions” and “legal or similarly significant effect” of automated decision-making on individuals are becoming increasingly sophisticated; the report showed that, in several cases, it was acknowledged that solely automated processing may include human involvement, and that courts and supervisory authorities consider the entire organizational environment, i.e., organizational structure, reporting lines or staff trainings, in order to decide whether a decision was solely automated or had meaningful human involvement.⁸⁷¹ While there is consensus that the processing of personal data which takes place in public interest is privileged,⁸⁷² it remains unclear whether processing may be based on commercial interests. In this context, the highest administrative court in the Netherlands published a highly anticipated judgment in July 2022 regarding assessment of legitimate interest under GDPR Article 6 (1 lit. f) to clarify whether purely commercial interests may qualify as legitimate interests within the meaning of GDPR Article 6 (1 lit. f)⁸⁷³ However, the court held that, in this specific case, the controller had other legitimate interests that could be relied on which were not exclusively commercial, and therefore, there was no need to consider the question of whether purely commercial interests could be considered a valid legal basis in the sense of GDPR Art. 6 lit f. legitimate interest.

5.4.3.7. Contract and vendor management

Much of the literature on GDPR is concerned with new requirements including controller and processor duties, which of course makes sense as companies have to comply with (partially) new rules – especially because, under the Regulation, practically everything is sanctioned as GDPR uses the general term “infringements of the provisions” and then specifies which type of infringement leads to which (maximum) fine.⁸⁷⁴ This was not the case under the previous regime with the Directive and national laws across the EU as penalties and sanctions were not harmonized and varied significantly in different Member States. The result was that, for example in Germany, for years, there were only sporadic sanctions according to § 44 of the pre-GDPR Federal Data Protection Act.⁸⁷⁵ Another difference is that enforcement is likely to change as national data protection supervisory authorities will be coordinating their enforcement powers across Member States: following an EDPB statement on enforcement cooperation,⁸⁷⁶ the Commission plans to change rules for cooperation and consistency, for example GDPR Art. 60 (3), and discussed a possible standardized rights of participation as suggested by EDPB. It is important to note that the maximum fine of up to 20 million Euros⁸⁷⁷ may be imposed for infringements in the framework of transfers of personal data to recipients in a third country or an international organization pursuant to GDPR Articles 44 to 49.⁸⁷⁸ Considering that data transfers outside the own organization and inside an undertaking is very common and that interconnectedness and globalization are growing, there is a definite necessity to review the existing (contractual) framework with suppliers, subsidiaries and parent companies.⁸⁷⁹ This is particularly true when an international context is given, because different rules may apply as simple data processing agreements might not be sufficient. It is likely that nowadays, most companies are aware of the need for a (contractual) data protection framework when data transfers are in question, but it is also questionable whether they are prepared for a proper contract and vendor management including background screenings, since there are differences between the Directive and the Regulation: GDPR establishes a cumulative liability regime for controllers and processors⁸⁸⁰ and thus foresees a joint and several liability. Controllers still carry primary responsibility for compliance, but processors have become subject to several obligations

⁸⁷⁴ See GDPR Article 83.

⁸⁷⁹ For the sake of simplicity, this paragraph does not cover issues of joint controllership.

⁸⁸⁰ Brendan van Alsenoy: Liability under EU Data Protection Law - from Directive 95/46 to the General Data Protection Regulation. *Journal of Intellectual Property, Information Technology and Electronic Commerce Law* 2016, p. 282.

and are directly liable towards data subjects in case of non-compliance.⁸⁸¹ Second, eventual fines will also depend on factors which are influenced by the processor's behavior and prehistory: mainly the degree of responsibility of the processor;⁸⁸² any relevant previous infringements the processor committed;⁸⁸³ any previous measures referred to in GDPR Article 58 (2) which have previously been ordered;⁸⁸⁴ the manner in which the infringement became known to the supervisory authority, in particular whether, and if so to what extent, the controller or processor notified the infringement.⁸⁸⁵ The framework for outsourcing of services which implies the processing of personal data did not change substantially, however, businesses must take note of the fact that outsourcing standards were altered as regards format and content. The latter depends on the jurisdiction,⁸⁸⁶ industry sector⁸⁸⁷ or profession in question.⁸⁸⁸ The GDPR provides that processing by a processor shall be governed by a contract or other legal act under Union or member state law, binding the processor to the controller.⁸⁸⁹ In the framework of a parliamentary question session in August 2018,⁸⁹⁰ the European Commission clarified that a legal act may be "an ordinance or other type of administrative decision whereby controllers vested in public authority may stipulate the conditions for processing personal data on their behalf". The Commission also addressed the question of the appropriate format of such an agreement as GDPR Article 28 (9) states that the contract or the other legal act referred to in paragraphs 3 and 4 shall be in writing, including the electronic format. It said that "the rules for entering into contracts or other legal acts, including in electronic form, are not set forth in the GDPR but in other EU and / or national legislation. The e-commerce Directive⁸⁹¹ provides for the removal of legal obstacles to the use of electronic contracts. It does not harmonize the form electronic contracts can take. In principle, automated contract processes are lawful. It is not necessary to append an electronic signature to contracts for them to have legal effects. E-signatures are one of several means to prove their conclusion and terms". On the one hand, GDPR

allows for more flexibility when data processing agreements are in question. On the other hand, real life will show whether businesses will make use of the above possibilities. If important contracts may be concluded in such an easy manner, this carries the risk that unauthorized staff may engage in contractual agreements. The same idea applies to amendments: if a simple email will suffice to change or amend a contractual arrangement, this may lead to undesired results. It is therefore probable that many companies will stick to the written format in favor of legal certainty. Exceptions seem likely for business models in which the controller offers an online platform for their suppliers in which they can easily access business relevant documents such as terms and conditions and conclude relevant contracts including data processing agreements. This type of process automation depends on the underlying cooperation in question and especially on whether the parties intend or desire to conclude standard contracts rather than negotiating agreements individually. Speaking of negotiating agreements individually – this is an extremely important topic when it comes to damages and liability as the Regulation provides that controllers and processors will be jointly and severally liable where they are both responsible for damage caused by their processing.⁸⁹² According to GDPR Article 82 (2) and (3), a processor “shall be liable for the damage caused by processing only where it has not complied with obligations of this Regulation specifically directed to processors or where it has acted outside or contrary to lawful instructions of the controller”. If a company acts as a processor, it shall be exempt from liability if it is able to provide proof that it is not in any way responsible for the event giving rise to the damage. In the event that one party pays all of the compensation for the damage, it is entitled to claim back relevant amounts from the other party.⁸⁹³ Since GDPR significantly increases possible fines, vendors may well try to shift present liability limits to their own favor. As a result, not only is there a need to review existing data processing agreements to check whether they match all new requirements; vendor management will become a key issue in the framework of business compliance. The invalidation of the Privacy Shield and subsequent regulator recommendations on supplementary measures such as transfer impact assessments is a good example of how important the profound selection and evaluation of appropriate service providers including underlying contractual agreements is.⁸⁹⁴ Controllers shall moreover examine their insurance policies to make sure that they have the needed coverage. The problem being that even data protection authorities will need some time to determine a reasonable and market standard approach to the appropriate allocation of risk and financial responsibility for such fines as between customers and third-party processors.⁸⁹⁵ Another point of criticism is that the GDPR is concerned with controllers and

⁸⁹⁵ ICO GDPR guidance – contracts and liabilities between controllers and processors. Guidance published 2018, available at <https://ico.org.uk/media/about-the-ico/consultations/2014789/draft-gdpr-contracts-guidance-v1-for-consultation-september-2017.pdf>. Retrieved October 24, 2021.

processors, but does not address manufacturers. Given the potential high impact of AI on individuals, many stress that it is important to come up with very clear liability rules and to take a holistic approach that covers all relevant players, including manufacturers, meaning that certain requirements as well as remedies and damages shall apply to them as well.⁸⁹⁶

5.4.3.8. Emphasis on governance and response mechanisms

Information and notification requirements which occur in the framework of data breaches⁸⁹⁷ are a perfect example of response mechanisms that are foreseen in the Regulation. The same applies to data subject requests as processes must be in place to check and fulfill individual requests for information, deletion, or data portability. Depending on the business model, this will either be resolved case-by-case or lead to the implementation of corresponding (self-service) tools.⁸⁹⁸ The difference being that the timeline for answering data subject request is different⁸⁹⁹ from the deadline for reporting data breaches: in the event of a personal data breach, the controller has to notify the competent supervisory authority without undue delay, where feasible, no later than 72 hours after having become aware of the data breach.⁹⁰⁰ But it is questionable whether it will be feasible to provide all necessary information⁹⁰¹ on such short notice. It seems likely that, in many cases, it will not be feasible to find all necessary details on the nature and consequences of the data breach, especially when service suppliers are involved, meaning that the controller is dependent on their approach to the incident. In addition, reporting on such short notice can only focus on ad-hoc-measures, but not on long-term security (preventive) technical and organizational measures, and that is why some believe that data breach notifications under GDPR are an unrealistic default and shall be corrected.⁹⁰² Given the breach and response mechanisms, (expert) manpower will be needed, and this is underlined by a wide of range of tasks needs to be fulfilled: from the implementation of relevant (information, data subject, design, reporting) processes, various

The authors summarize the current stage of the right to data portability and report that major social platforms are offering data portability functions. Retrieved October 24, 2021.

⁸⁹⁹ Depending on case and circumstances, the controller may take up to three months: GDPR Article 12 (3), first and second sentence: “The controller shall provide information on action taken on a request under Articles 15 to 22 to the data subject without undue delay and in any event within one month of receipt of the request. That period may be extended by two further months where necessary, taking into account the complexity and number of the requests”.

⁹⁰⁰ See GDPR Article 33 (1).

⁹⁰¹ See GDPR Article 33 (3) specifies which details must be provided in the framework of a breach notification.

⁹⁰² On April 3 2019, the German state of Lower Saxony proposed amendments to data protection provisions to the Germany Federal Council, and one of the motions was to review the current deadline for data breach notifications as set forth in GDPR Article 33 (1) for adequacy, see: <https://www.datenschutzticker.de/2019/04/niedersachsen-schlaegt-aenderung-datenschutzrechtlicher-bestimmungen-im-bundesrat-vor/>. Retrieved October 24, 2021.

documentation and (risk) assessment needs over data minimization, quality, security and retention issues up to the management of breaches and third parties – all this together with the need to make sure that the lawfulness of the processing of all personal data the organization holds is given (including proof of legal grounds/origin of data/ rules for special data) can only be achieved if a corresponding governance structure is present. GDPR Article 5 (2) stipulates that the controller is responsible and “must be able to demonstrate compliance with paragraph 1”, i.e., the basic principles relating to processing of personal data such as accuracy, integrity and confidentiality, lawfulness, fairness and transparency as well as purpose and storage limitation. That means that, regardless of the question of whether a Data Protection Officer must be appointed,⁹⁰³ organizations must make sure that there are individuals accountable for data protection. The above requirements show that, rather to sticking to certain conditions which must be met for certain data, the Regulation requires the overall modeling of various processes and procedures based on relevant documentation for evidentiary purposes, i.e., company’s privacy programs that are not based on paper compliance but live on existing processes. If, for example, a certain data processing is based on legitimate interests or if the underlying purposes for a certain data processing operation is to be changed or amended, the corresponding assessment and reasoning must be demonstrated even years later. At the same time, governance needs lead to an ongoing assessment, which is also of relevance for Big Data and AI applications, since businesses will have to review their level of compliance with GDPR requirements for every newly introduced set of data and for every newly introduced (purpose for) data processing.

5.4.4. GDPR’s challenges

5.4.4.1. Heterogeneous and indeterminate terms

In the framework of data subject rights, the Regulation uses the terms fundamental rights and freedoms, but deviations in the interpretation of the Regulation could result from the fact that GDPR Articles 22 (2) b and 35 (7) c which relate to profiling and impact assessments use the term “rights and freedoms”, whereas GDPR Articles 4 (24) or 6 (1) lit. f and 23 (1) which relate to legitimate interests and restrictions of obligations and rights provided for in GDPR Articles 12 to 22 and Article 34, use the term fundamental rights and freedoms. Fundamental rights and freedoms are governed by the Charter of Fundamental Rights and the European Convention on Human Rights, and the starting point for the interpretation of this term is the fundamental right to the protection of personal data pursuant to Article

⁹⁰³ The requirement to appoint a DPO varies between Member States, see GDPR Article 37 (4). Depending on certain circumstances like industry and business model, organizations may have to appoint more than data protection officers, for instance, compliance officers (e.g., banking sector) or authorized recipients (e.g., in the framework of the German Network Enforcement Act). Another example is the mandatory contact person as foreseen in the e-evidence proposal.

8 of the Charter,⁹⁰⁴ since these terms must be interpreted within the context of European law and not according to a purely national understanding⁹⁰⁵. The problem is that, prior to GDPR, national interpretation of data protection regulations dominated the application and transposition of data protection law into national law within the EU for decades.⁹⁰⁶ Another challenge is that other sources of law which are part of the (global) data protection framework use a different terminology. While the Charter of Fundamental Rights and the draft of the ePrivacy-Regulation are concerned with “data protection”, the European Convention on Human Rights deals with the “respect for private life”, the Council of Europe Convention 108 as well as the corresponding OECD Guidelines talk about “privacy”, the Data Protection Directive and the General Data Protection Regulation speak about “(fundamental) rights and freedoms” of natural persons, while the Charter of Fundamental Rights or the draft ePrivacy Regulation also deal with the protection of “communications”.⁹⁰⁷ The notion of privacy is not exactly the same like data protection, and the core issue in this context is that the applicability of data protection rules depends on these terms. As regards data subject rights, the Regulation uses the term interests⁹⁰⁸ without providing further background information like is the case with other terms (articles). This term comprises economic, financial, and other, intangible interests,⁹⁰⁹ but the question is how such broad concepts shall be balanced against each other as both, data subjects and controllers have economic, financial as well as tangible and intangible interests. Data subject rights such as the right to information / right of access show how important the correct interpretation of legal terms indeed is: a German case demonstrated the explosive power of right to copy⁹¹⁰ in the framework of the termination of an employee. The problem is that the wording of GDPR Article 15 (3) can be understood in a manner that allows for an interpretation which leads to the result that the person concerned must be provided with a copy of each e-mail, document and note he has ever written or received. The seemingly simple right to copy is a good example of how important it is to further concretize data subject rights. Another example of the challenges around terminology, definitions and / or indeterminate terms is that, while many terms

⁹⁰⁴ This basically covers all fundamental rights which are at least indirectly protected by data protection law: Datenschutzkonferenz: Risiko für die Rechte und Freiheiten natürlicher. Working Paper no. 18, p. 1, published April 26 2018, available at https://www.lda.bayern.de/media/dsk_kpnr_18_risiko.pdf. Retrieved October 24, 2021.

⁹⁰⁵ Datenschutzkonferenz: Risiko für die Rechte und Freiheiten natürlicher. Working Paper no. 18, p. 1, published April 26 2018, available at https://www.lda.bayern.de/media/dsk_kpnr_18_risiko.pdf. Retrieved October 24, 2021.

⁹⁰⁶ Coherence mechanisms were usually only important for BCRs or the like; businesses typically faced the problem of multiple interpretation of the law in multiple jurisdictions, especially as there are typical overlaps with other areas of law such as labor or competition or IT-security laws.

⁹⁰⁷ Winfried Veil: Die Schutzgutmisere des Datenschutzrechts (Teil II). Article published February 6 2019, available at <https://www.cr-online.de/blog/2019/02/06/die-schutzgutmisere-des-datenschutzrechts-teil-i/>. Retrieved October 24, 2021.

⁹⁰⁸ For example, GDPR Articles 6 (1) lit. f and Article 9 (2) lit. b or Article 49 (1) lit. c.

⁹⁰⁹ Datenschutzkonferenz: Risiko für die Rechte und Freiheiten natürlicher. Working Paper no. 18, p. 3 published April 26 2018, available at https://www.lda.bayern.de/media/dsk_kpnr_18_risiko.pdf. Retrieved October 24, 2021.

⁹¹⁰ Niko Härting: Mit der DSGVO zum “Golden Handshake” – von der Sprengkraft des “Rechts auf Kopie”. Article published March 29 2019, available at <https://www.cr-online.de/blog/author/haerting/>. Retrieved October 24, 2021.

have been defined in the Regulation, there are no definitions or specific articles on highly relevant business activities such as marketing, despite the fact that advertising, (online) tracking and profiling are an important element of business operations. One exception is Recital 47 which deals with the admissibility of direct marketing in the framework of legitimate interests, but further clarification would have been helpful since Big Data and AI applications are frequently used for marketing purposes, and the situation gets more complicated if one takes a look beyond the GDPR. This is necessary because, depending on the processing scenario in question, the admissibility of the operation is not only governed by data protection law, but competition, e-commerce, and / or consumer protection laws, and the question is what is *lex specialis*, which rules are stricter, etc. For example, one interpretation of this specific Recital would affirm the admissibility of direct e-mail-marketing, but the perspective of national laws against unfair competition could be that consent is required: the German competition law (Gesetz gegen den unlauteren Wettbewerb, UWG) is based on Directive 2002/58, the so-called ePrivacy Directive (PECD), and some believe that it would have been more suitable to enshrine this regulation in data protection law.⁹¹¹ The relationship between the PECD and the GDPR does not seem to be clear: even though Recital 173 says that “this Regulation should apply to all matters concerning the protection of fundamental rights and freedoms vis-à-vis the processing of personal data which are not subject to specific obligations with the same objective set out in Directive 2002/58/EC of the European Parliament and of the Council, including the obligations on the controller and the rights of natural persons”, the second sentence of the Recital shows that there is a necessity for further clarification: “In order to clarify the relationship between this Regulation and Directive 2002/58/EC, that Directive should be amended accordingly. Once this Regulation is adopted, Directive 2002/58/EC should be reviewed in particular in order to ensure consistency with this Regulation.”

5.4.4.2. Unclear protective goals

The above discussion on relevant, consistent and future-proof legal terms is closely connected to the question of the purposes of data protection in the sense of: what exactly is to be protected? What is so valuable that no deviations are accepted? As for the latter, GDPR Article 9 (2) a makes a clear statement on the relationship of sensitive data and individuals’ consent: the processing of sensitive data such as health, biometric or genetic data or personal data revealing racial or ethnic origin, political opinions, religious or philosophical beliefs or trade union membership is not permitted unless certain exceptions which are listed in GDPR Article 9 (2) lit. a to lit. j apply. One exception is that the data subject has given explicit consent to the processing of those personal data for one or more specified purposes – but Union or member state law may provide that the prohibition may not be lifted by the data subject. This is an important aspect as it shows that individual’s rights and freedoms have limitations, which can also

⁹¹¹ Helmut Köhler: Die Umsetzung der Richtlinie über unlautere Geschäftspraktiken in Deutschland – eine kritische Analyse. Gewerblicher Rechtsschutz und Urheberrecht 2012, pp. 1073 and 1079.

be demonstrated in different settings: while one may claim to have certain entries deleted, this may not always work in the anticipated manner, for example, when the desired deletion could lead to censorship, or when freedom of press is concerned.⁹¹² With regards to data subject rights, the following examples may explain what shall be protected: the right to be forgotten is about the right to make a fresh start,⁹¹³ and the right not to be subject to automated decision-making is perhaps rather about enabling due process and preventing discrimination⁹¹⁴ than about objecting to sophisticated data processing, and the principles of fairness and storage limitation reflect these ideas. Whenever the sense behind data protection regulation is questioned, there is a tendency to summarize data protection legislation by saying that data protection is not about the protection of data, but about the protection of the individuals behind the data. However, it is important to realize that, while GDPR wants to strengthen data subject rights by protecting “fundamental rights and freedoms of natural persons and in particular their right to the protection of personal data”,⁹¹⁵ it also aims at ensuring the free flow of personal data: “the free movement of personal data within the Union shall be neither restricted nor prohibited for reasons connected with the protection of natural persons with regard to the processing of personal data.”⁹¹⁶ Another important aim GDPR wanted to achieve as a reaction to the previous Directive that did not make it to harmonize data protection within the EU is questionable due to a variety of so-called opening clauses.⁹¹⁷ Moreover, processing is regularly possible when public interests are in question, which underlines that data processing that takes place in public interest is privileged.⁹¹⁸ And that is not the only relevant aspect: many courts confirmed that data protection requirements may, depending on the case,⁹¹⁹ also be relevant to competition law as competitors may issue warnings,⁹²⁰ meaning that data protection laws may not

⁹¹² Ivor Shapiro, Brian MacLeod: How the “Right to be Forgotten” challenges journalistic principles. Article published 18 November 18 2016, available at <https://www.tandfonline.com/doi/abs/10.1080/21670811.2016.1239545?journalCode=rdij20>. Retrieved October 2, 2021.

⁹¹³ Raphael Gellert: Understanding data protection as risk regulation. *Journal of Internet Law* 2015, pp. 3-15.

⁹¹⁴ In his article, the author stresses that the biggest issues stemming from automated data processing are not violations of privacy, but social sorting practices which are discriminating and infringe upon the right to due process, see Raphael Gellert: Understanding data protection as risk regulation. *Journal of Internet Law* 2015, pp. 3-15.

⁹¹⁵ See GDPR Article 1 (2).

⁹¹⁶ See GDPR Article 1 (3).

⁹¹⁷ The GDPR contains dozens of opening clauses allowing EU Member States to put national data protection laws in place to supplement the GDPR. A summary on this topic is provided by Julia Kaufmann, Michael Schmidl, Holger Lutz (editors) for Baker McKenzie in their GDPR national legislation survey. Survey published January 2018, available at https://www.bakermckenzie.com/-/media/minisites/tmt/files/gdpr_national_legislation_survey.pdf?la=en. Retrieved October 2, 2021.

⁹¹⁸ See GDPR Article 6 (1) lit. e which allows for the processing of personal data when public interest is in question, even for sensitive data (GDPR Article 9 (2) lit. g, even for data transfers to third countries (GDPR Article 49 (1) lit. d).

⁹¹⁹ Some authors believe that it is likely that infringements of transparency needs may lead to the issuance of warnings, whereas other violations shall not automatically serve as a justification for competitors to initiate actions, see Marlene Schreiber: Drohen wettbewerbsrechtliche Abmahnungen wegen Verstößen gegen die DSGVO? Article published July 4 2018, available at <https://www.haerting.de/neuigkeit/drohen-wettbewerbsrechtliche-abmahnungen-wegen-verstoessen-gegen-die>. Retrieved October 24, 2021.

only result in claims by individuals, but claims by competitors. It is furthermore interesting to note that certain jurisdictions acknowledged that data protection laws not only protect natural persons, but also protect legal persons, which questions the notion and connection between data protection laws and fundamental rights.⁹²¹ As regards the Regulation, GDPR says that individuals' (fundamental) "rights and freedoms" shall be protected. But the scope and concrete content of this statement is unclear. The challenge is that this is an important prerequisite as none of the many interpretation issues of the GDPR can be answered in a satisfying manner as long as the protected good(s) remain unclear: the problem is that, without an identification of the protective goals and the protected goods, it is hard to find a benchmark for numerous considerations controllers have to undertake in the framework of various necessity, proportionality, compatibility and risk tests, and that is why some conclude that the GDPR is an example of the misery of data protection laws.⁹²² In the US, the FTC states that data protection is about consumer protection,⁹²³ and this view is comprehensible as the example of preset (default) checkboxes demonstrates. It is a good example of inadmissible practices which are not tolerated, neither from a data or consumer protection nor from a competition law perspective, meaning that various laws go hand in hand, which is why data protection shall not be judged in isolation. A literal interpretation of the Regulation allows for the assumption that individuals' controls as part of their privacy self-management are anchored: several Recitals operate with the term "control" when talking about rights and freedoms of natural persons: Recital 7 says that natural persons shall have control over their own data, and Recital 75 deals with risks to rights and freedoms of data subjects and explains that risks may occur when data subjects are prevented from exercising control over their personal data. Recital 85 specifies that a "personal data breach may, if not addressed in an appropriate and timely manner, result in physical, material or non-material damage to natural persons such as loss of control over their personal data". Altogether, these text passages reinforce the importance of exercising control in the framework of data subject rights, but the comprehensive protective purpose of the Regulation which is expressed in the detailed catalogue of examples for potential risks and harms Recital 75 presents, is viewed

⁹²³ However, there are discussions about whether an additional federal authority shall be introduced in the U.S. to cover Internet privacy and data security as this could enhance consumer protection, see U.S. Government Accountability Office: Internet Privacy and Data Security – additional federal authority could enhance Consumer protection and provide flexibility. Statement published March 7 2019, available at <https://www.gao.gov/products/GAO-19-427T>. Retrieved October 24, 2021.

critically by some authors who say that “no life risk of this world remains unmentioned in Recital 75”,⁹²⁴ and they thus question where data protection ends. In this regard, other authors underline that data protection law, unlike other areas of law, does not dispose of limiting, restrictive criteria and is thus about to change the nature of the data protection regime to a fully prehensive cover.⁹²⁵ Other authors raise similar concerns by saying that, owing to the fact that more and more data may be considered as personal data, literally any handling of data will be subject to data protection laws,⁹²⁶ which could lead to undesired incentives for companies to abandon de-identification and therefore increase rather than alleviate privacy risks. It is undisputed that the question of whether information may be viewed as personally identifiable is a fundamental normative question, but the way in which data protection laws (and corresponding sanctions) shall be interpreted and applied very much depends on the question on what exactly is to be protected. Some authors suggest that data protection shall be interpreted as a legal framework for the regulation and risks to fundamental rights.⁹²⁷ They claim that mechanisms and tools of data and risk regulation are similar as both rely on methods which involve proportionality (balancing) testing, and they also stress that data protection was a technology-specific legislation at the time of its emergence.⁹²⁸ The simple reason for this is that data protection laws were a reaction to technical developments. Record keeping existed for centuries, the difference is that new technologies pose new risks.⁹²⁹ This argument is underlined by the fact that, for example, the 1980 OECD Guidelines apply to “personal data, which, because of the manner in which they are processed, (...) pose a danger to privacy and individual liberties”.⁹³⁰

⁹²⁴ Niko Härting: Wann ist eine Datenverarbeitung eigentlich erforderlich? Article published February 1 2019, available at <https://www.cr-online.de/blog/2019/02/01/wann-ist-eine-datenverarbeitung-eigentlich-erforderlich/>. Retrieved October 24, 2021.

5.4.4.3. Significance of accountability

The issue of indeterminate legal terms has not only been raised in the framework of basic definitions, the interpretation of terms is also relevant for the meaning and scope of the accountability principle.⁹³¹ The term accountability itself only appears in GDPR Article 5 (2) and GDPR Article 24 (1). According to GDPR Article 5 (2), the “controller shall be responsible for, and be able to demonstrate compliance with, paragraph 1 (‘accountability’).” GDPR Article 24 (1) says that the “controller shall implement appropriate (...) measures to (...) be able to demonstrate that processing is performed in accordance with this regulation”. It is clear that the accountability principle leads to a catalogue of tasks businesses have to perform in order to demonstrate that they are compliant with the Regulation, for example by preparing corresponding documentation to serve as evidence.⁹³² The Regulation pursues a risk-based approach⁹³³ as Recitals 75 and 76 clearly show that GDPR distinguishes between processing activities with a high and those with a low likelihood and severity of risks to the rights and freedoms of data subjects. Various articles of the General Data Protection Regulation stress this approach, for example GDPR Articles 35 and 36: data protection impact assessment, GDPR Articles 33 and 34: data breach notification, GDPR Article 25: data protection by design and by default and GDPR Article 32: security of processing.⁹³⁴ As a result, low-risk processing activities face a reduced compliance burden, but it is questionable what shall be considered (minimum) standard and therefore subject to fines if there is a proven lack of compliance. In this regard, there is controversy within literature as to whether businesses may claim for themselves the principle of proportionality in the sense of a limitation of the level of requirements to what is commensurate and reasonable.⁹³⁵ The scope of documentation obligations is only one question; the other issue is that relationship between the controller’s obligation to provide evidence has to be balanced against the supervisory authority’s duty to investigate an incident: even if a regulator has good reason to approach a controller or processor, businesses may well have the duty of cooperation, but there is no duty of self-accusation,⁹³⁶ because it is up to the competent supervisory authority to examine the case meaning that it is up to the authority to ensure enlightenment.⁹³⁷ The

Article published November 8 2018, available at <https://www.cronline.de/blog/2018/11/08/post-von-der-datenschutzbehoerde-risiken-des-wohlverhaltens/>. Retrieved October 24, 2021.

investigation principle is a basic principle of administrative procedural law,⁹³⁸ which is accompanied by the right not to incriminate themselves. An (absurd) comparative example would be that any driver would have to demonstrate that he or she always obeyed all traffic rules.⁹³⁹ Another problem is that further regulations such as the draft AI Act introduced further roles and responsibilities. This shall be welcomed as this may help establish a liability regime and capture all parties involved in the AI value chain, but this further complicates the situation, especially for complex processing operations within joint controllership scenarios, meaning that one and the same party may hold several roles.

5.4.4.4. Persistence of fragmentation

GDPR aimed at providing a single framework for data protection to provide an adequate response to the fact that Member States had a different level of implementation in times of the Directive. The result was that European data protection laws in many cases were substantially different. GDPR's goal to harmonize data protection law is actually questionable given the large number of opening clauses,⁹⁴⁰ which leads to a number of areas in which businesses may have to cope with different national requirements in each member state, for example, employment law.⁹⁴¹ The same applies in the context of freedom of expression, processing of data for academic and artistic purposes,⁹⁴² or when personal information is processed for reasons of national security.⁹⁴³ Other out-of-scope areas include the processing of national ID numbers⁹⁴⁴ and personal data contained in official documents.⁹⁴⁵ Member States may moreover create their own rules in relation to controllers or processors which are subject to obligations of professional secrecy.⁹⁴⁶ The result is that some requirements are no longer governed by national law or have been abandoned,⁹⁴⁷ while many other data processing scenarios continue to be governed by national law.⁹⁴⁸ The problem is reinforced by the growing complexity of the legal

⁹⁴⁷ For example, the registration requirement with the local supervisory authority.

⁹⁴⁸ This includes the processing personal data in the context of churches and religious establishments (GDPR Article 91, Recital 165). However, this provision is unlikely to be of practical significance for majority of organizations.

landscape, more and more data protection laws are applicable throughout the world,⁹⁴⁹ and the emerging legal framework in the U.S. is also a crucial factor to consider as any data privacy statutes that apply to US-headquarters companies like Amazon, Google, Microsoft, or Meta may de facto have a global impact since these companies process a huge portion of business and personal data globally.

5.4.4.5. Shifting of the protection of fundamental rights

If the processing of personal data becomes more difficult, because valid consent is – for a variety of reasons – difficult to obtain, and the processing cannot be justified with the fulfillment of a contract as set forth in GDPR Article 6 (1) lit. b, then the only way to defend the data processing is to use legitimate interests as a legal justification. Consequently, some authors claim that GDPR Article 6 (1) lit. f, that is: legitimate interests, will play a central role in the future of data processing including Big Data and AI applications. The challenge with this development is that, if companies decide about data subject rights in the framework of balancing their fundamental rights and freedoms against their own economic interests, this leads to a shift of the data protection regime because the private sector becomes the responsible body for the individuals’ data protection. Some authors are very critical about such “outsourcing of fundamental rights protection” to controllers.⁹⁵⁰ If legitimate interests become the central aspect of processing in the framework of Big Data and AI applications, this may lead to a self-regulatory regime which many criticize as AI ethics washing⁹⁵¹ they compare to green washing used in marketing. If companies’ project managers decide upon the design and implementation of algorithmic applications, the problem is that these staff members are not trained or qualified in data protection, and another issue to keep in mind is that they are potentially prejudiced: it may well be assumed that diverging interests between data subjects and organizations are given, and it may also be assumed that the latter could prevail. The complexity of the data protection regime as such is argument enough to envisage that employees could simply be overwhelmed by data protection issues, and employees’ economic dependencies on their employer as the data controller will likely make them follow their employer’s instructions.

⁹⁴⁹ The broad territorial scope of many new data protection laws is similar to the GDPR, for example, Brazil’s LGPD, see Caitlin Fennessy: Top five operational impacts of Brazil’s LGPD. Part 3: international transfers. Article published November 5 2020, available at <https://iapp.org/news/a/top-5-operational-impacts-of-brazils-lgpd-part-3-international-transfers/>. 5.4.4.6. Viability of traditional concepts

Many authors reflected on the issue of future-proof definitions⁹⁵² and the Regulation's future-viability⁹⁵³ as much of its concept is based on principles which date back to an era in which technology was not as sophisticated as it is now. Even though the General Data Protection Regulation is a piece of legislation that was created in times when Big Tech and social media companies already existed, the whole setting in which personal data is being processed changed. A significant difference is that previously, data used to be a by-product of the purpose for which the data was collected while today, the exact opposite is the case as data is no longer a simple by-product. A "positive day in the life" of a modern citizen is characterized by constant data processing: ambient intelligence at home, connected cars and smart cities on their way to work, mobile devices at the workplace, customer loyalty systems in supermarkets, and Internet searches or the use of health and dating apps in the evening. A "bad day" in the life of a modern citizen may be due to CCTV surveillance and facial recognition in public spaces, mandatory use of biometric data to access systems, unpleasant online experiences such as behavioral tracking, undesired search results, or may be based algorithms deciding to raise the price for shopping cart items owing to profiling and device fingerprinting, or the fact that AI turned down an application for an interesting job or rejected a loan for a new house based on scoring. We are now dealing with players whose dominance is so strong that even antitrust authorities felt called to intervene. "Alphabet controls our search and much of our mobile experience, Apple controls the remainder of our mobile and much of our content experience, Amazon controls a large portion of our content experience and much of the Internet of Things, and Microsoft essentially sweeps up everything else."⁹⁵⁴ There is hardly any escape: using the right browser settings may not help as many websites do not respond to such settings;⁹⁵⁵ using alternative browsers may not help as associates illegal activities within the dark web,⁹⁵⁶ and refraining from the use of apps may not help as collateral data is collected,⁹⁵⁷ exercising individuals rights may not help as this is only addressed to one controller as opposed to a network of operators processing data. But processing of personal data is nowadays characterized by the interaction and networking of many actors: very often,

data passes through many service providers, very often crossing many national borders. It can no longer be assumed that individual parties face each other, and that is why longstanding legal approaches may not be suitable anymore. Protections that were traditionally and primarily directed against the state and its institutions, and not against private companies, may simply not work. Data subject rights such as the right to information, the right to object, or the right to withdraw consent may not afford the needed protections. Data protection principles like purpose limitation⁹⁵⁸ or data minimization⁹⁵⁹ may not lead to the required limitations, and best practices like fair information⁹⁶⁰ or notice and choice⁹⁶¹ may not result in the necessary transparency. That is all the more true given that many processing operations can be justified by legitimate interests and compatible processing in accordance with GDPR Article 6 (1) lit. f and 6 (4). Far too often, information duties are fulfilled in a legalistic manner, consent degenerated to a mere click mechanism, and many average users have no idea what can be done with their data. These examples show that the challenges we are facing in data protection today have substantially changed, and that concepts like privacy self-management do not seem to be viable anymore. GDPR's focus on individuals' rights and risks as opposed to societal implications as well as GDPR's catalogue of duties for controllers and processors as opposed to all players involved in the AI value chain may be considered a bad thing. However, GDPR's emphasis on processes and not only data⁹⁶² together with its risk-based approach are a good thing – and something that is not embedded in other legal initiatives that operate with exhaustive high-risk AI lists.⁹⁶³

5.5. Rules at national level

5.5.1. National data protection laws

One of GDPR's main goals was to harmonize data protection rules throughout Europe. However, owing to various mandatory and optional opening clauses,⁹⁶⁴ Member States shall and may carve out exceptions

within the Articles of the Regulation. It was therefore necessary for Member States to pass GDPR implementation laws.⁹⁶⁵ As a result, businesses will have to comply with both, the legal framework of the GDPR and (potentially deviating) national legal frameworks of the specific countries where they operate.⁹⁶⁶ In addition, due to GDPR's wider scope, even companies who do not have their seat within the European Union are also required to comply with GDPR. U.S. businesses face further challenges, because they must comply with the so-called Fair Information Practice Principles and various national data privacy laws. In this respect, California is a good example: just like GDPR, the California Consumer Privacy Act⁹⁶⁷ may also apply to companies located outside California,⁹⁶⁸ but even though both laws share some general features, their actual provisions are not the same.⁹⁶⁹ As a result, companies that are subject to multiple jurisdictions will have to make a significant effort to achieve compliance with all relevant regulations to achieve compliance, particularly when sector-specific (e.g., banking, health, etc.) rules have to be obeyed as well. It can therefore generally be said that the problem of (undesired) fragmentation of laws remains significant. Depending on the organization in question, legal uncertainty may worsen, and legal complexity may increase.

5.5.2. U.S. privacy laws

Safe Harbor and the Privacy Shield were common examples of privacy frameworks, and even though the United States at present do not have a uniform federal data protection law comparable to the GDPR, it is certainly wrong to assume that there is no privacy legislation: prominent examples of U.S. privacy laws include (sector-specific) laws like the Health Insurance Portability and Accountability Act (HIPAA)⁹⁷⁰ and the Children's Online Privacy Protection Act (COPPA).⁹⁷¹ Many states either already have or are about to introduce laws to establish data privacy (and security) requirements for the

operations, leverage commercially available AI technologies, and increase productivity in predictive supply chain and logistics.¹⁰³³ The other is the Quantum Computing Cybersecurity Preparedness Act¹⁰³⁴ which intends to address challenges that arise out of the fact that current encryption protocols used by the federal agencies might one day be vulnerable as a result of Quantum Computing.¹⁰³⁵

5.5.3. Consumer protection laws

U.S. laws show that there is a connection between privacy protection and consumer protection; the title of most privacy bills in the U.S. already indicates that the law is about protecting consumers. Examples in this context are the Gramm-Leach-Bliley Act (GLBA)¹⁰³⁶, the Telemarketing Sales Rule (TSR)¹⁰³⁷ as well as the Telephone Consumer Protection Act (TCPA)¹⁰³⁸ and the CAN SPAM Act¹⁰³⁹. Another prominent example is the Fair Credit Reporting Act (FCRA)¹⁰⁴⁰ that applies in the context of housing, insurance, employment and credit: while, for example, traditional credit scoring is based on traditional characteristics such as historical information on how individuals meet their credit obligations, modern scoring works with non-traditional characteristics such as social media usage or shopping behavior: analysis on historical information about the individual in question is replaced by predictive analytics based on a comparison of other consumers' behaviors.¹⁰⁴¹

5.5.4. Competition law

GDPR does not contain a specific article on marketing, but Recital 47 (7) states that “the processing of personal data for direct marketing purposes may be regarded as carried out for a legitimate interest”.¹⁰⁴² One may thus suggest that contacting individuals via electronic mail for commercial purposes is admissible. However, Article 13 of the ePrivacy Directive obliges Member States to prohibit unsolicited e-mail advertising.¹⁰⁴³ As for the relationship between the PECD and GDPR, GDPR Article 95 says that GDPR applies to all data protection issues unless special provisions with the same regulatory objective result from PECD.¹⁰⁴⁴ Therefore, the prevailing opinion in Germany is that this provision thus leads to the fact that § 7 UWG is retained with the consequence that e-mail advertising is only possible with the explicit consent of the recipient¹⁰⁴⁵ - contrary to many jurisdictions with “can-spam-acts”¹⁰⁴⁶ or “soft opt-in”-concepts.¹⁰⁴⁷ E-mail-marketing may not be a standard use case of Big Data.¹⁰⁴⁸ But the legal framework which governs the activity is a good example of how complex the situation for globally active businesses has become. Moreover, harvesting of contact details such as email-addresses from a website or proprietary online service using automated means is a method of data collection in preparation of Big Data analytics, and this is explicitly covered (forbidden) in certain jurisdictions.¹⁰⁴⁹

¹⁰⁴² Provided that a (documented) balancing of interests took place.

¹⁰⁴³ The German legislator has fulfilled this obligation by creating § 7 UWG (Gesetz gegen den unlauteren Wettbewerb, the German Federal law against unfair competition).

¹⁰⁴⁴ Recital 173 (Relationship to Directive 2002/58/EC) says that “This Regulation should apply to all matters concerning the protection of fundamental rights and freedoms vis-à-vis the processing of personal data which are not subject to specific obligations with the same objective set out in Directive 2002/58/EC of the European Parliament and of the Council¹, including the obligations on the controller and the rights of natural persons. In order to clarify the relationship between this Regulation and Directive 2002/58/EC, that Directive should be amended accordingly. Once this Regulation is adopted, Directive 2002/58/EC should be reviewed in particular in order to ensure consistency with this Regulation”.

¹⁰⁴⁵ Detailed background information is provided by Katrin Rammo: E-Mail-Werbung künftig auch ohne Einwilligung möglich? Article published March 30 2017, available at <https://www.datenschutzbeauftragter-info.de/e-mail-werbung-kuenftig-auch-ohne-einwilligung-moeglich/>. Retrieved October 3, 2021.

¹⁰⁴⁶ In February 2019, the Federal Trade Commission voted to retain the U.S. “Can Spam Act”: <https://www.lexology.com/library/detail.aspx?g=6379a9eb-e07d-495d-8118-f804647303d5>. Retrieved October 3, 2021.

¹⁰⁴⁷ While the basic rule in many countries is that businesses must not send marketing emails to individuals without specific/prior consent, a typical exception applies for own previous customers. UK’s Information Commissioner’s Office offers background information on the so-called “soft-opt-in” on their website, available at <https://ico.org.uk/for-organisations/guide-to-pecr/electronic-and-telephone-marketing/electronic-mail-marketing/>. Retrieved October 3, 2021.

¹⁰⁴⁸ Even though email marketing activities are subject to different analyses of click rates and the like.

¹⁰⁴⁹ Email harvesting without authorization is prohibited under section 5 (b) of the 2003 U.S. Can Spam Act, see <https://www.ftc.gov/sites/default/files/documents/cases/2007/11/canspam.pdf>. Retrieved October 3, 2021.

5.5.5. IT security laws including cyber security and Internet of Things

It is hardly feasible to provide an overview over all applicable IT-, IoT and cyber-security laws.¹⁰⁵⁰ However, data protection is not possible without data security, and it is therefore a must to include a brief overview over IT-security laws: against the background of increasing threats like cyber-attacks, industrial espionage and owing to the growing complexity of IT infrastructures, many European countries enacted IT-/cyber-security laws of their own.¹⁰⁵¹ Given the importance of the issue, similar laws exist in most jurisdictions, including the U.S.A., where the Internet of Things Cybersecurity Improvement Act has recently been introduced.¹⁰⁵² The U.S.A. also have specific data breach laws at both, federal¹⁰⁵³ and state level.¹⁰⁵⁴ With regards to key state data privacy and security laws, all U.S. states have breach notification laws.¹⁰⁵⁵ In addition, case law confirms and concretizes certain entrepreneurial obligations, for example, in the area of IT-outsourcing, or disaster and recovery management.¹⁰⁵⁶

5.5.6. Equal opportunity laws

The U.S.A. are a good example of a country with a multitude of laws that prohibit discrimination based on characteristics such as age, gender, disability, race, origin or marital status: e.g., a lender must not refuse to offer (certain conditions for) loans to a single person as opposed to a married person even if

¹⁰⁵⁰ There are not only laws, but also recommendations, for instance, European Commission recommendation on cyber-security in the energy sector which builds on EU legislation in this area, including the NIS Directive and EU Cyber-Security Act. The recommendation was issued on April 3 2019, and is available at https://ec.europa.eu/energy/sites/ener/files/commission_recommendation_on_cybersecurity_in_the_energy_sector_c2019_2400_final.pdf. Retrieved October 3, 2021.

¹⁰⁵¹ For example, Germany with its 2015 IT-Sicherheitsgesetz (German IT Security Act). This act amends and supplements the German federal Energy Industry Act, the Tele-Media Act, the Telecommunications Act, and other laws. Background information is provided by the German Federal Office for Security in Information Technology at their website, available at https://www.bsi.bund.de/DE/Themen/Industrie_KRITIS/KRITIS/IT-SiG/Neuregelungen_IT_SiG/neur_IT_SiG_node.html. Retrieved October 3, 2021.

Big Data analytics suggest that single persons are less likely to pay back their mortgage than married individuals.¹⁰⁵⁷ Other examples of equal opportunity laws are the Age Discrimination in Employment Act,¹⁰⁵⁸ the Fair Housing Act,¹⁰⁵⁹ and the Genetic Information Nondiscrimination Act¹⁰⁶⁰ to only name a few.

5.5.7. Labor law and industrial constitution laws

Variations of the applicable legal framework may also arise in labor law,¹⁰⁶¹ especially when company-internal rules arising from works council agreements¹⁰⁶² have to be considered on top of existing employment law. This can lead to restrictions in the use of data since such agreements can stipulate that certain (performance-relevant) data must not be processed or analyzed. The employment context is generally a good example as regards admissible use of information, including applicable timings: while it may not be permissible to collect data on the fact that an applicant is pregnant, once the employment relationship is established, the same person will have to report this circumstance because the employer has a duty of care and is obliged to implement protective measures if need be (depending on the workplace). However, all such constraints are only relevant to analyses which are carried out based on employee data, a much smaller use case¹⁰⁶³ than in other areas.

5.6. Specific rules for algorithm-based processing, ADM, and AI

In the context of data protection laws which must be taken into consideration when it comes to algorithm-based processing, ADM, and AI, sector-specific rules (e.g., banking) as well as product (e.g., health appliance), incident (e.g., data breach), infrastructure (e.g., certain types of plants) and data-specific (e.g., information relating to children) rules apply. Moreover, data residency rules may require

¹⁰⁶⁰ A factsheet on the Genetic Information Nondiscrimination Act is available at the U.S. Equal Employment Opportunity Commission's website: <https://www.eeoc.gov/laws/guidance/fact-sheet-genetic-information-nondiscrimination-act#:~:text=Title%20II%20of%20the%20Genetic%20Information%20Nondiscrimination%20Act,training%20and%20apprenticeship%20programs%2C%20and%20the%20federal%20government>. Retrieved October 3, 2021.

¹⁰⁶¹ A simple example is that the German Federal Data Protection Law enacted in the course of the introduction of GDPR (as a basic rule with exceptions) requires written consent from employees (see § 26 II 3 BDSG).

¹⁰⁶² See GDPR Article 88, processing of personal data in the context of employment.

¹⁰⁶³ Those are in many cases due to compliance requirements, for instance, background screenings, analysis of admissible Internet usage.

that (a copy of) data is stored locally also must be considered.¹⁰⁶⁴ Other provisions may foresee that certain information (e.g., technical data, data worthy of protection for reasons of national security) must be handled in a certain manner and / or stored locally, meaning that trade compliance may also lead to challenges with regards to export controlled data being stored in the Cloud.¹⁰⁶⁵ To name all relevant provisions would go beyond the scope of this work, so that this section of the Thesis only serves to point out that, depending on the type of business activity, sector-, product and further specific rules may apply which have to be obeyed as well.¹⁰⁶⁶ This circumstance increases the legal complexity, because sector-specific regulations exist at national (federal) and at EU level, both in the EU and in the US: compliance-rules such as anti-money-laundry provisions and the like typically exist at national level; federal data breach notification requirements for the financial and health sector are a typical example sector-specific U.S. laws at federal level,¹⁰⁶⁷ whereas the Clinical Trial Regulation¹⁰⁶⁸ is an example of an industry-specific regulation at EU level. This regulation intends to harmonize the market as regards clinical trials and medicinal products and introduces rules on the protection of individuals, including informed consent and transparency requirements.¹⁰⁶⁹ It thus contains specific data protection provisions including rules on the secondary use of clinical trial data outside the clinical trial protocol for scientific purposes, which may become relevant in the context of Big Data and AI applications.¹⁰⁷⁰ The emergence of laws that specifically address algorithm-based processing and automated decision-making are probably best

¹⁰⁶⁴ Consequently, specialized data-residency-as-a-service vendors emerged as Ryan Chiavetta reports in his 2019 article: Tech vendor looks to tackle data localization compliance. The article was published July 18 2019, and is available at <https://iapp.org/news/a/tech-vendor-looks-to-tackle-data-localization-compliance/>. Retrieved October 3, 2021.

demonstrated by the fact that specific bills have been enacted to regulate the use of automated employment decision tools, e.g., New York's city local law 144,¹⁰⁷¹ New Jersey¹⁰⁷² and New York.¹⁰⁷³

5.6.1. Regulations at international and sectoral level

5.6.1.1. Vienna Convention on Road Traffic, UN Regulation on Automated Lane Keeping Systems

Even though some consider that the regulation of AI is in its infancy, there are indeed advanced regulations in certain industries, and that is especially true with regard to autonomous driving: the 1968 Vienna Convention on Road Traffic was amended in 2016¹⁰⁷⁴ in order to allow for transferring driving tasks to autonomous vehicles (AV); AV is considered one of the most remarkable use cases and one of the most critical components in the so-called Fourth Industrial Revolution,¹⁰⁷⁵ and many countries engage in testing of such vehicles,¹⁰⁷⁶ or enacted corresponding legislation.¹⁰⁷⁷ And there is further development in the area of autonomous vehicles: while for example an autopilot system is level 2, new rules on Automated Lane Keeping Systems (ALKS) that come into force in 2021 are the first international binding regulation¹⁰⁷⁸ on level 3; level 5 is fully automated with features that can drive the vehicle under all conditions.¹⁰⁷⁹ In recent years, discussions around the (applicable or appropriate)

autonomous weapons systems and united in delivering a first-of-its-kind joint statement on the issue.¹⁰⁸⁹ Human Rights Watch and the Harvard Law School International Human Rights Clinic issued a report¹⁰⁹⁰ on the matter and have proposed a treaty-making process to safeguard humanity from autonomous weapons systems.

5.6.1.3. MiFID II¹⁰⁹¹

The banking sector is a highly regulated sector¹⁰⁹² and yet another example of an industry that already has rules for algorithms that are being used for high frequency algorithmic trading,¹⁰⁹³ and this shows that AI regulation is perhaps not any more in its infancy.

5.6.2. Rules at national and state level AI, ADM, and further algorithmic-specific rules

Apart from the fact that the United States seem to be moving towards a comprehensive federal privacy and data protection legislation for some time already¹⁰⁹⁴ – the Congress also released a draft federal privacy law titled the “American Data Privacy and Protection Act” in June 2022¹⁰⁹⁵ – the U.S. engaged in numerous legal initiatives in the area of Artificial Intelligence as the following examples show: the

Advancing American AI Act,¹⁰⁹⁶ the Future of AI Act,¹⁰⁹⁷ the National Artificial Intelligence Initiative Act,¹⁰⁹⁸ the Artificial Intelligence Act¹⁰⁹⁹, the Algorithmic Accountability Act,¹¹⁰⁰ the AI in Government Act,¹¹⁰¹ the Artificial Intelligence Reporting Act,¹¹⁰² the Advancing AI Research Act,¹¹⁰³ the Growing Artificial Intelligence Through Research Act,¹¹⁰⁴ the Mind Your Own Business Act,¹¹⁰⁵ or the Protecting Americans from Dangerous Algorithms Act.¹¹⁰⁶ The country moreover plans for the establishment of a National Security Commission on Artificial Intelligence¹¹⁰⁷ and is also very active in the area of Automated Decision Making: many states already have ADM legislation, for example California, Virginia and Colorado, and many others are discussing similar initiatives.¹¹⁰⁸ What these laws have in common is that they “borrow some terms and ideas from the EU’s General Data Protection Regulation,”¹¹⁰⁹ for example, by foreseeing that internal duties include risk assessments and that external duties include meaningful information of individuals. The interesting development in this context is that, for example, the Colorado Privacy Act¹¹¹⁰ says that Data Protection Assessment for high-risk profiling will be required to be made available to the Attorney General upon request. However, unlike the GDPR,

many of these laws are concerned with consumers¹¹¹¹ and not addressed towards individuals, which leads to the question if privacy protections do not apply to individuals which do not qualify as consumers. Obviously, such a variety of definitions and such a high degree of fragmentation will lead to challenges at implementation level. But unlike the EU which only has guidance at regulator level,¹¹¹² the U.S. have explicit rules on so-called dark patterns,¹¹¹³ i.e., methods to misinform or inappropriately influence users' behavior and manipulate consumer actions, ranging from annoying-but-innocent to unlawful design of websites and applications: this violates existing laws such as Section 5 of the FTC Act, and data privacy laws like the California Privacy Rights Act which explicitly regulates dark patterns.¹¹¹⁴ In June 2022, Canada introduced the Digital Charter Implementation Act¹¹¹⁵. If passed, this package of laws will reform the Canadian privacy law including a tribunal specific to privacy and data protection – and implement Canada's first AI legislation, the Artificial Intelligence and Data Act (AIDA): AIDA aims at protecting individuals from the harms and biased outputs AI systems are capable of generating and establishes requirements for the design, development, use, and provision of AI systems; it furthermore mandates impact assessments, and foresees administrative monetary penalties, or even criminal offences for certain conduct in relation to AI systems.¹¹¹⁶

5.7. Purpose and data-(processing) specific rules

5.7.1. Biometric data and facial recognition

Apart from the above-mentioned rules for the finance industry as well as autonomous weapons and vehicles, there are further areas of AI for which specific rules already exist. In this regard, facial recognition technology is a good example: in the US, Illinois passed the Biometric Information Privacy

¹¹¹¹ For example, Virginia's CDPA or the New Jersey Disclosure and Accountability Transparency Act, see Pollyanna Sanderson: Automated decision systems legislation update.

Act (BIPA) already in 2008,¹¹¹⁷ and Maryland¹¹¹⁸ and Mississippi¹¹¹⁹ are considering BIPA-like biometric information privacy laws. Several states (for example California, Texas) and numerous cities (for example San Francisco, Seattle or Oakland) either already have or are planning to ban the use of the facial recognition;¹¹²⁰ ditto for further cities around the globe that are taking joint efforts to defend digital rights at municipal level.¹¹²¹ The opposite is true for China: millions of cameras are used for facial (and voice) recognition that can identify people and monitor their behavior for identification¹¹²² or surveillance purposes.¹¹²³ Some claim that the rollout of biometric identification systems is likely to exacerbate ethnic profiling.¹¹²⁴ The fact that Clearview, a tool that allows to identify individuals based on a single photo, has been used by police¹¹²⁵ shows that the wish to use such technology is present in many countries: in the framework of its border management, the European Union decided – without great public impact – to introduce a biometrics database which includes fingerprints and facial scans, the “Common Identity Repository.”¹¹²⁶ The database was designed to allow for better tracking of immigration and criminals and will be one of the largest information systems for retrieving biometric data worldwide, putting Europe “right behind the Chinese government and India’s Aadhar system in terms of the size of people-tracking databases”. There is fear that the system may be expanded to track people that are not the subject of criminal investigations, for example tourists, and this way, millions of

EU citizens might be affected, and not only criminals.¹¹²⁷ Some therefore consider this to be a harmful step and comment on the initiative as “a Big Brother centralized EU database including all existing and future Justice and Home affairs databases.”¹¹²⁸ Against this background, the campaign “Reclaim Your Face” calls for a ban on mass surveillance with the help of biometric information, demanding that authorities take note of serious risks implied with the use of facial recognition and other biometric technologies in public spaces¹¹²⁹ - and not only in public spaces: today’s technology shows that the use of static information that would have previously been considered non-sensitive data should be reconsidered, because it became fairly easy to, for example, manipulate pictures by “morphing faces to influence voters”¹¹³⁰, or by producing a Deep Fake to embarrass or expose someone¹¹³¹ or by identifying the individuals behind those photos¹¹³² – or by erasing them from a group picture.¹¹³³ Recent developments in Iran underlined how important facial recognition may indeed be: the country uses face recognition to identify women breaking Hijab laws.¹¹³⁴

5.7.2. Genetic information and health data privacy bills

Florida enacted a new genetic privacy law in October 2021 which establishes four new crimes related to the unlawful use of another person’s DNA, the Protecting DNA Privacy Act.¹¹³⁵ Florida is only one of many examples within the U.S.A. of a state that demonstrates an increased focus on genetic privacy protections: California, Arizona and Utah have also started developing genetic privacy laws to govern

privacy practices, for example of direct-to-consumer genetic testing.¹¹³⁶ Apart from laws on biometric and genetic data or facial recognition, and on top of the well-established Health Insurance Portability and Accountability Act, numerous states started working on laws that would create new or additional privacy protections for health data which are processed by private entities, for example, New York,¹¹³⁷ Virginia,¹¹³⁸ and Washington.¹¹³⁹ This is positive on the one hand, on the other hand, it adds to the fragmentation and lack of consistency since these laws do not apply to the public sector. The development in health data privacy shall be closely monitored given the importance for AI in the health sector, especially in diagnostics.¹¹⁴⁰

5.7.3. Children's privacy bills

In the U.S., the 1998 Children's Online Privacy Protection Act¹¹⁴¹ is not the only legislation that regulates children's privacy. It imposes certain requirements on website operators and online services directed to children under 13 years of age,¹¹⁴² which is important because this is exactly the right target group for today's digital world. By now, several U.S. states are considering enacting bills that deal with the protection of minors, for example, New Jersey,¹¹⁴³ Oregon,¹¹⁴⁴ Texas,¹¹⁴⁵ West Virginia¹¹⁴⁶. Moreover, there are important age-appropriate design initiatives at EU and national level: the European

Commission will facilitate a comprehensive EU Code of conduct on age-appropriate design ¹¹⁴⁷ which builds on the regulatory framework provided in the GDPR and other laws, and in the UK, ICO¹¹⁴⁸ issued an age-appropriate design code for apps, connected toys and devices and news services.

5.7.4. Data broker bills

From a business perspective, it is furthermore worthwhile to have a look at bills that address data brokers since these companies may be valuable for Big Data and AI applications because data brokers may offer services such as enriching datasets; from an individual's perspective, the monetization of such data is not just annoying, it may pose a real threat to their lives, for example when location data about individuals visiting abortion clinics is made available.¹¹⁴⁹ It should also not be forgotten that data brokers by definition¹¹⁵⁰ are companies that sell data on individuals with whom they have no direct business relationship – which is the opposite of data subjects controlling what happens to their personal data. Therefore, legal initiatives in the context of data broker activities shall be highly welcomed. At present, California addresses data brokers in the CCPA,¹¹⁵¹ and Delaware¹¹⁵² and Vermont¹¹⁵³ are working on bills that would regulate data brokers, and the same applies to New Jersey¹¹⁵⁴ and Oregon.¹¹⁵⁵

5.7.5. Automated employment decision tools bills

Like is already the case with New York's city local law 144,¹¹⁵⁶ further states, i.e., New Jersey¹¹⁵⁷ and New York¹¹⁵⁸ are currently considering laws that would regulate the use of automated employment decisions. This is in fact highly relevant because it reflects applicants' reality as almost 70 percent of all recruiters use some sort of automated decision making in the application process,¹¹⁵⁹ but the problem is that ADM tools that are used in the application process and / or in the employment context may lead to discrimination and bias¹¹⁶⁰ like the example of Amazon¹¹⁶¹ showed.

5.8. Private sector initiatives

Telecommunication companies like Telefónica,¹¹⁶² Vodafone¹¹⁶³ or German Telekom¹¹⁶⁴ were amongst the first ones to think about company-own standards and rules with regards to the use of AI. Other

Like many others who believe in the future of this technology, Microsoft is involved in research in the topic¹¹⁸⁰ and runs a project with the Massachusetts Institute of Technology's Computer Science & Artificial Intelligence Lab on Trustworthy & Robust AI Collaboration.¹¹⁸¹ Given the fact that Microsoft's applications are used by the vast majority of organizations¹¹⁸², the company is in the spotlight of the authorities more than others: Microsoft was criticized for some of its AI-based Office 365 applications, for example Delve and Graph: a German regulator conducted two surveys on the use of Microsoft Office 365 in 2019 to find out how local companies use Office 365,¹¹⁸³ and local labor chambers also dealt with Graph, Delve and MyAnalytics since these applications are relevant for the working environment.¹¹⁸⁴ Controversial discussions around associated data protection risks of (Microsoft) Office 365 are still ongoing between regulators.¹¹⁸⁵ Moreover, the Dutch Ministry of Security and Justice commissioned a data privacy impact assessment for Microsoft Office ProPlus¹¹⁸⁶ which came to the result that the use of Microsoft's Office ProPlus Enterprise indeed involves privacy risks,¹¹⁸⁷ and in mid-2020, the European Data Protection Supervisor initiated an own investigation into EU institutions' use of Microsoft products and services.¹¹⁸⁸ Apple communicates a different approach: even though not tailored with a specific regard to AI, its consent for IDFA¹¹⁸⁹ initiative is an example of how Privacy by Design could be a "game changer for online and mobile privacy and drive change in a way that legislative efforts have so far been unable".¹¹⁹⁰ if users cannot be tracked and targeted without

their consent, this will necessarily impact further data processing as is the custom nowadays: since consent is only valid if it is obtained in an informed manner, it is questionable whether the implementation of opt-in-mechanisms that are typically tailored as a one-time effort can be considered legally valid as this would mean that one single declaration of intent towards an unknown and / or growing number of legally independent entities that engage in different processing operations could suffice as opposed to the repeated solicitation of consent for various companies and different purposes. Apple recently released the latest version of its iPhone operating system, iOS 15: this new operating system brings a slew of privacy-specific features such as the “Mail Privacy Protection” feature and the “Privacy Report” feature which allows users to check how (often) apps are using (which of) their data.¹¹⁹¹

5.9. Technical standards

5.9.1. ISO standards

GDPR generally requires appropriate technical and organizational measures to protect personal data, and this is where the International Organization for Standardization (ISO) comes into play: given the complexity and growth of regulatory requirements, compliance is increasingly difficult to achieve, and that is why some companies consider certifications like ISO 27001, the international standard for Information Security Management Systems (ISMS); ISO 27701 is concerned with Privacy Information Management System (PIMS). ISO issued another standard for the protection of personally identifiable information in public clouds. ISO/IEC 27018:2014 is a new code of practice which promotes privacy protection in the cloud. It establishes guidelines “in order to implement measures to protect personally identifiable information in accordance with the privacy principles in ISO/IEC 29100 for the public cloud computing environment”.¹¹⁹² Key topics include controls, accessibility and portability as well as secondary use of data and data breaches.¹¹⁹³ Even though some GDPR requirements are not covered, ISO controls¹¹⁹⁴ can be a starting point for achieving the necessary technical and operational requirements to reduce risks of data processing activities as those standards deals with e.g. risk assessment, Privacy by Design and supplier relationships. Moreover, ISO intends to establish a

- ISO/IEC AWI 25059 – *Quality model for AI-based systems (Systems and software Quality Requirements and Evaluation: SQuaRE)*.¹²¹¹

The ISO is moreover working on several standards for data quality for analytics and Machine Learning: part 1¹²¹² provides an overview and covers terminology and examples; part 2¹²¹³ deals with quality measures, part 3¹²¹⁴ governs data quality management, and part 4¹²¹⁵ provides a data quality process framework. What is truly remarkable is that ISO announced to introduce a new standard for Privacy by Design, ISO/DIS 31700 in early 2023:¹²¹⁶ fourteen years after its introduction by former Canadian privacy commissioner, Privacy by Design is about to become an international privacy standard for the protection of consumer products and services. However, ISO 31700 will not be a conformance standard.¹²¹⁷

5.9.2. CEN, CENELEC and ETSI standards

As regards relevant technical standards, it is vital to know that such standards will play an important role in the context of the draft AI Act, even though technical standards are not mentioned in the EU’s draft Artificial Intelligence Act.¹²¹⁸ technical standards will be jointly developed by the European standardization bodies, the European Committee for Standardisation (CEN), the European Committee for Electrotechnical Standardisation (CENELEC), and the European Telecommunications Standards

Institute (ETSI). Providers do not have to follow these standards, but the advantage is that they would enjoy a presumption of conformity.¹²¹⁹ Despite the fact that the standards are presented as voluntary, that might perhaps not be realistic, for the following reasons: a harmonized approach is a safer option¹²²⁰ because the alternative would be that providers would have to interpret the AI Act's essential requirements for themselves, which in effect may lead to far more effort and this way, far more cost. This is especially true given that global industry players prefer international standards over national or regional standards because they create a level playing field in markets throughout the world.¹²²¹ As a result, technical standards will be crucial in bringing down compliance costs that they have been defined as the "real rulemaking".¹²²² The standardization bodies will focus on topics like risk management, governance, cybersecurity, documentation requirements, data quality and accuracy, transparency and information to users as well as human oversight, and post-market monitoring; they will also define the validation procedures and methodologies for assessing if an AI system is fit-for-purpose and whether it meets those standards, and, amongst other things, submit a progress report to the European Commission every six months.¹²²³ From a European perspective, standards are moreover a means of regaining digital sovereignty by engaging in the definition of technological standards for emerging technologies in strategic areas by promoting EU interests in international standardization bodies to counter growing international competition.¹²²⁴ The European Telecommunications Standards Institute is also actively engaged in this area.¹²²⁵

5.9.3. IEEE standards

Irrespective of the bodies involved in technical standards to support the conformity of AI systems in the framework of EU’s new draft AI law, it is worth looking at other technical standards to complete the picture of standardization in the context of AI. In this regard, the IEEE plays an important role: apart from IEEE’s Ethically Aligned Design that has been specifically created to address ethical and human values when it comes to the design and use of AI,¹²³³ IEEE is also engaged in an impressive number of initiatives in the area of autonomous and intelligent systems such as:

- *IEEE P7003 – Algorithmic Bias Considerations;*¹²³⁴
- *IEEE P7001 – Transparency of Autonomous Systems;*¹²³⁵
- *IEEE P7000 – Draft Model Process for Addressing Ethical Concerns During System Design;*¹²³⁶

IEEE furthermore offers an ethics certification program for Autonomous and Intelligent Systems (ECPAIS) to create specifications for certification and advance accountability and transparency and this way, reduce algorithmic bias. IEEE says that the “value of this certification process in the marketplace and society at large cannot be underestimated. The proliferation of systems in the form of smart homes, companion robots, autonomous vehicles or any myriad of products and services that already exist today desperately need to easily and visually communicate to consumers and citizens, whether they are deemed “safe” or “trusted” by a globally recognized body of experts providing a publicly available and transparent series of marks.”¹²⁴⁰

5.9.4. ITU standards

The International Telecommunication Union (ITU) is the United Nations agency for information and communication technologies. The ITU is part of the AI for good initiative¹²⁴¹ and issued the following documents that are relevant for AI:

- *ITU-T Y.3531 Cloud computing – functional requirements for Machine Learning as a service.*¹²⁴²
- *Y.Suppl.63 to ITU-T Y.4000 series – Unlocking Internet of things with Artificial Intelligence: Where we are and where we could be.*¹²⁴³

- *ITU-T Y. 4470 – Reference architecture of Artificial Intelligence service exposure for smart sustainable cities.*¹²⁴⁴

This chapter demonstrated that there are numerous relevant sources of law at international, European, and national level, including sector and industry specific as well as data and processing specific rules, and regulations that address algorithm-based decision-making and AI. It can generally be said that data protection and data privacy laws are on the rise. Even though the GDPR can be considered a role model law that inspired many legislative initiatives around the globe, GDPR also poses challenges due to unclear protective goals, indeterminate terms, or fragmentation. Another important aspect is that the legal framework for AI shall not be seen in isolation since other relevant sources of law provide for rules that crucial from a data protection perspective as well, for example, with regards to liability, product safety, trade secrets or digital content. In summary, the legal landscape in the context of algorithmic data processing is not in its infancy, and the presumption of conformity gives rise to hope that this circumstance will attract companies to engage in relevant new technical standards.

6. Guidance, recommendations, and initiatives

This chapter provides a detailed overview over existing recommendations, guidance, and initiatives in the context of AI at institutional, international, European, and national level. It includes regulator guidance as well as civil society and multistakeholder recommendations, or expert guidelines. What these recommendations have in common is that they address potential issues when Big Data and AI applications are designed and implemented from an ethics, legal, accountability, societal and individual, including data protection and privacy perspective. Even though these initiatives are non-binding, they are promising and inspiring because they discuss new concepts, new controller obligations, or new data subject rights. They moreover demonstrate that already now, there is an impressive number of initiatives that reflect on the challenges of today's digital world, which is truly useful given that Big Data and AI is being used across the board, for example, in production (robotics), for operations (forecasting), in marketing (analytics), in the finance (scoring) and in the healthcare sector (diagnostics), in “smart cities,” “smart homes,” and “smart devices” or for tracking and targeting purposes.

6.1. Guidance and recommendations at international level¹²⁴⁵

6.1.1. OECD AI principles

The 2019 OECD principles on Artificial Intelligence¹²⁴⁶ aim to promote AI that respects democratic values, human rights, the rule of law as well as transparency and diversity and are the first intergovernmental standard that has been adopted by 42 countries. OECD's principles have been developed by a 50+ member expert group on AI who named the following five complementary value-based AI principles:¹²⁴⁷

- I. *“AI should benefit people and the planet by driving inclusive growth, sustainable development, and well-being¹²⁴⁸.”*
- II. *AI systems should be designed in a way that respects the rule of law, human rights, democratic values, and diversity, and they should include appropriate safeguards – for example, enabling human intervention where necessary – to ensure a fair and just society.*
- III. *There should be transparency and responsible disclosure around AI systems to ensure that people understand AI-based outcomes and can challenge them.*
- IV. *AI systems must function in a robust, secure, and safe way throughout their life cycles and potential risks should be continually assessed and managed.*
- V. *Organizations and individuals developing, deploying, or operating AI systems should be held accountable for their proper functioning in line with the above principles”.*

Consistent with these value-based principles, the OECD also adopted recommendations¹²⁴⁹ for national (government) AI policy priorities which shall also be read in the context of OECD's Privacy Principles:

- I. *“Facilitate public and private investment in research & development to spur innovation in trustworthy AI.*

¹²⁴⁵ Given the fact that there is an intersection between, for instance, civil society and multistakeholder initiatives, it is not always possible to clearly distinguish and properly group various AI recommendations and guidelines.

¹²⁴⁶ Background information on OECD's work in AI is available at <http://www.oecd.org/going-digital/ai/principles/>. Retrieved October 3, 2021.

¹²⁴⁷ Background information on as well as the text of OECD's AI principles, their AI Policy Observatory, or framework for the classification of AI systems is available at <https://www.oecd.org/going-digital/ai/principles/#:~:text=The%20Recommendation%20identifies%20five%20complementary%20values-based%20principles%20for,proper%20functioning%20in%20line%20with%20the%20above%20principles>. Retrieved October 3, 2021.

¹²⁴⁸ Bold Italic means emphasis added.

¹²⁴⁹ Further details on OECD's recommendations available at <http://www.oecd.org/going-digital/ai/oecd-moves-forward-on-developing-guidelines-for-artificial-intelligence.htm>. Retrieved October 3, 2021.

- II. *Foster accessible AI ecosystems with digital infrastructure and technologies and mechanisms to share data and knowledge.*
- III. *Ensure a policy environment that will open the way to deployment of trustworthy AI systems.*
- IV. *Empower people with the skills for AI and support workers for a fair transition.*
- V. *Co-operate across borders and sectors to progress on responsible stewardship of trustworthy AI.”*

6.1.2. G20, G7 and World Economic Forum recommendations on AI

In 2019, the G20 formulated human-centered AI principles¹²⁵⁰ which are inspired by OECD’s AI principles. These guidelines stress that AI shall be fair, transparent, and accountable and that it shall respect privacy, equality, diversity as well as internationally recognized labor rights. The latter is important since the use of AI is believed to create a new virtual workforce.¹²⁵¹ The G20 statement thus also addresses complementary digital economy issues. In addition, Think20, a task force of the G20 research and policy advice network that is working on the future of work and education in the digital age, focuses on AI-based learning technologies to overcome current educational challenges.¹²⁵² G20 AI principles are split into two sections, the first section deals with principles for responsible stewardship of trustworthy AI and focuses on:

- I. *“Inclusive growth, sustainable development, and well-being,*
- II. *Human-centered values and fairness,*
- III. *Transparency and explainability,*
- IV. *Robustness, security, and safety,*
- V. *Accountability.”*

The second section is about national policies and international co-operation for trustworthy AI and stresses the need for international co-operation, investing in AI research, fostering a digital ecosystem for AI, shaping a policy environment for AI, and building human capacity and preparing for labor market

¹²⁵⁰ G20 Ministerial Statement on Trade and Digital Economy including human-centered AI published June 9 2019, available at <http://www.g20.utoronto.ca/2019/2019-g20-trade.html>. Retrieved October 3, 2021.

¹²⁵² Samed Olukoya: Think20 says Artificial Intelligence based learning technologies can overcome current educational challenges. Article published August 25 2020, available at <https://investorsking.com/2020/08/25/think20-says-artificial-intelligence-ai-based-learning-technologies-can-overcome-current-educational-hallenges/>. Retrieved October 3, 2021.

transformation.¹²⁵³ In 2018, G7 leaders issued the Charlevoix Common Vision for the Future of Artificial Intelligence,¹²⁵⁴ and the World Economic Forum published a White Paper on AI¹²⁵⁵ in which the following four central principles are proposed: fairness and active inclusion as well as the right to understanding and the right to redress. The World Economic Forum moreover suggests that companies take the following steps to prevent discriminatory outcomes: being transparent about efforts to identify, prevent, and mitigate human rights risks; identifying human rights risks linked to business operations, and taking effective action to prevent and mitigate risks.

6.1.3. United Nations

6.1.3.1. IWGDPT's Working Paper and ITU's AI for good initiative

In 2018, the International Working Group on Data Protection in Telecommunications (IWGDPT) issued a working paper¹²⁵⁶ which identified the following main issues regarding data protection: lack of transparency and intelligibility, erosion of consent and purpose limitation, the risk of re-identification as well as risk of detecting sensitive information. Their key recommendations are fairness and respect of fundamental human right, accountability, privacy and ethics by design and non-discrimination. Together with various other UN organizations and the Association for Computing Machinery, the International Telecommunication Union (ITU)¹²⁵⁷ organized the AI for Good Global Summit, the leading United Nations platform to foster the dialogue on beneficial use of AI.¹²⁵⁸ In accordance with the United Nations Sustainable Development Goals (SDG), this initiative is focusing on using AI for sustainable development. The summit established various focus groups, for example AI for Health, Machine Learning for Future Networks (5G), Environmental Efficiency for AI and other Emerging Technologies, AI for Autonomous and Assisted Driving and the AI for Good Repository; the ITU moreover intends to draft technical reports and specifications for Machine Learning.¹²⁵⁹ AI for Good

focuses on the following key areas: accountability, fairness, transparency, explicability, robustness, safety and security as well as inclusive growth, sustainable development and well-being based on human-centered values.

6.1.3.2. UNESCO: Recommendation on the Ethics of Artificial Intelligence, Beijing declaration on Artificial Intelligence and Education

In 2020, the United Nations Educational, Scientific and Cultural Organization (UNESCO) set up an international expert group composed of “the world’s leading experts on the social, economic and cultural challenges of Artificial Intelligence to draft internationally applicable recommendations on ethical issues raised by the development and use of AI”.¹²⁶⁰ With the goal to develop the first global normative instrument on this key issue,¹²⁶¹ UNESCO’s Ad Hoc Expert Group (AHEG)¹²⁶² provided a recommendation¹²⁶³ on the ethics of Artificial Intelligence in which they stress the importance of human dignity, privacy, fairness, transparency, safety, accountability, human oversight as well as sustainability, diversity and inclusiveness, and the need to address social, economic, employment and environmental consequences of AI; the following areas of policy action have been identified in the framework of their recommendation: governance, ethical stewardship, impact assessments, capacity building and international cooperation for AI Ethics. UNESCO stresses that AI has the potential to address some of the biggest challenges in the field of education by allowing for innovative teaching and learning practices. Against this background, UNESCO published¹²⁶⁴ the Beijing Consensus on Artificial Intelligence and Education.¹²⁶⁵ In addition, UNESCO published an AI Decision Makers’ Toolkit¹²⁶⁶ to help address certain issues that arise from AI’s role in the context of education, including gender equality as well as challenges in online disinformation and hate speech.

6.1.3.3. UNICEF: AI for Children

As part of their Artificial Intelligence for Children Policy project,¹²⁶⁷ the United Nations Children’s Fund (UNICEF) developed a policy guidance¹²⁶⁸ on “how to promote children’s development in AI strategies and practices (...) to bring a balanced perspective to the policy table with clear, usable principles for implementing AI that supports child rights” as a response to the fact that, despite the growing interest in and application of AI, little attention has so far been paid to how it affects children and their rights.¹²⁶⁹

6.1.3.4. United Nation’s Special Rapporteur on the Promotion and Protection of the Right to Freedom of Opinion and Expression

The report of the United Nation’s Special Rapporteur on the Promotion and Protection of the Right to Freedom of Opinion and Expression¹²⁷⁰ dealt with implications of AI technologies for human rights and underlined the importance of freedom of opinion and expression, individual autonomy, the right to privacy and to effective remedy, the obligation of non-discrimination and the need for human rights impact assessments and audits.

6.1.3.5. UNICRI’s center on AI and Robotics

In 2015, UNICRI, the United Nations Interregional Crime and Justice Research Institute established a center on AI and robotics to “help focus expertise on Artificial Intelligence (AI) throughout the UN in a single agency.”¹²⁷¹ The center’s focus is on awareness-raising, exchange of information education, and harmonization of relevant stakeholders.

6.1.4. UNI Global Union top 10 Principles for Ethical Artificial Intelligence

UNI Global Union (UNI) is a global union federation for national and regional trade unions representing 650 trade unions in the fastest growing sectors in the world, skills and services.¹²⁷² UNI is concerned

with protecting workers' rights and since Artificial Intelligence may change the "Future World of Work",¹²⁷³ UNI joined the multi-stakeholder Partnership on AI (PAI)¹²⁷⁴ and developed top 10 principles for ethical AI in order to "put people and planet first"¹²⁷⁵ which demands AI to meet the following criteria: AI systems shall be transparent, equipped with an ethical black box, operate in a genderless and unbiased manner, adopt a human-in-command approach, serve people and planet, and ensure fundamental freedoms and rights. Finally, UNI calls for a ban on the attribution of responsibility to robots and the AI arms race.

6.2. Guidance and recommendations at European level

6.2.1. Ethics Guidelines for trustworthy AI

In 2018, 25 European countries signed a declaration of cooperation on Artificial Intelligence in which they declare their willingness to join forces and engage in a European approach to the topic.¹²⁷⁶ In 2019, the High-Level expert group on Artificial Intelligence presented ethics guidelines for trustworthy Artificial Intelligence.¹²⁷⁷ The High-Level Expert Group on Artificial Intelligence (HLEG) is an independent group of expert that was set up by the European Commission as part of the AI strategy in 2018.¹²⁷⁸ On the one hand, they recognize that AI is a key driver for economic growth through the digitalization of industry; on the other hand, according to these guidelines, AI can only be considered trustworthy if it respects applicable laws and regulations and if it respects certain ethical principles and values. The guidelines explain the following conditions that AI systems must meet to be considered trustworthy:¹²⁷⁹

1. ***"Human agency and oversight:***¹²⁸⁰ *AI systems should empower human beings, allowing them to make informed decisions and fostering their fundamental rights. At the same time, proper*

¹²⁷³ Background information on UNI's work is available at <http://www.thefutureworldofwork.org>. Retrieved October 3, 2021.

¹²⁸⁰ Bold means emphasis added.

oversight mechanisms need to be ensured, which can be achieved through human-in-the-loop, human-on-the-loop, and human-in-command approaches

- II. **Technical Robustness and safety:** *AI systems need to be resilient and secure. They need to be safe, ensuring a fall-back plan in case something goes wrong, as well as being accurate, reliable and reproducible. That is the only way to ensure that also unintentional harm can be minimized and prevented.*
- III. **Privacy and data governance:** *besides ensuring full respect for privacy and data protection, adequate data governance mechanisms must also be ensured, taking into account the quality and integrity of the data, and ensuring legitimized access to data.*
- IV. **Transparency:** *the data, system and AI business models should be transparent. Traceability mechanisms can help achieving this. Moreover, AI systems and their decisions should be explained in a manner adapted to the stakeholder concerned. Humans need to be aware that they are interacting with an AI system and must be informed of the system's capabilities and limitations.*
- V. **Diversity, non-discrimination and fairness:** *Unfair bias must be avoided, as it could have multiple negative implications, from the marginalization of vulnerable groups to the exacerbation of prejudice and discrimination. Fostering diversity, AI systems should be accessible to all, regardless of any disability, and involve relevant stakeholders throughout their entire life circle.*
- VI. **Societal and environmental well-being:** *AI systems should benefit all human beings, including future generations. It must hence be ensured that they are sustainable and environmentally friendly. Moreover, they should take into account the environment, including other living beings, and their social and societal impact should be carefully considered.*
- VII. **Accountability:** *Mechanisms should be put in place to ensure responsibility and accountability for AI systems and their outcomes. Auditability, which enables the assessment of algorithms, data and design processes plays a key role therein, especially in critical applications. Moreover, adequate an accessible redress should be ensured."*

To assess whether an AI system that is being developed, deployed, procured or used, complies with HLEG's requirements of Trustworthy AI, the High-Level Expert Group on Artificial Intelligence furthermore issued an Assessment List for Trustworthy AI (ALTAI)¹²⁸¹ which aims to provide a basic self-evaluation tool for trustworthy AI.

¹²⁸¹ ALTAI is a self-assessment tool to help assess whether or not an AI system that is being developed, deployed, procured or used, complies with HLEG's requirements for Trustworthy AI. Background information on ALTAI is available at <https://altai.insight-centre.org/>. Retrieved October 3, 2021.

6.2.2. European Ethical Charter on the Use of AI in Judicial Systems (CEPEJ)

Certain countries have taken steps to introduce algorithmic decisions in the area of justice or policing¹²⁸² for purposes like the prevention of offences, evaluation of the risk of recidivism and the assessment of the level of danger by using AI to ensure a better predictability of crime or decisions. It is therefore necessary to think about a corresponding legal framework. Consequently, the European Commission for the Efficiency of Justice (CEPEJ) came up with an Ethical Charter on the Use of AI in Judicial Systems and their Environment in 2018.¹²⁸³ This first charter on AI in judicial systems aims at improving the quality and efficiency of the European judicial systems and at compliance with fundamental rights guaranteed in the European Convention on Human Rights and the Council of Europe Convention on the Protection of Personal Data,¹²⁸⁴ and names five basic principles which have to be obeyed when AI is used in the judicial area:

- I. ***“Principle of respect for fundamental rights:***¹²⁸⁵ *ensure that the design and implementation of Artificial Intelligence tools and services are compatible with fundamental rights.*
- II. ***Principle of non-discrimination:*** *Specifically prevent the development or intensification of any discrimination between individuals or groups of individuals.*
- III. ***Principle of quality and security:*** *With regard to the processing of judicial decisions and data, use certified sources and intangible data with models conceived in a multi-disciplinary manner, in a secure technological environment.*
- IV. ***Principle of transparency, impartiality and fairness:*** *Make data processing methods accessible and understandable, authorize external audits.*
- V. ***Principle “under user control”:*** *Preclude a prescriptive approach and ensure that users are informed actors and in control of their choice.”*

¹²⁸⁵ Bold means emphasis added.

6.2.3. European Commission

6.2.3.1. White Paper on Artificial Intelligence

In early 2020, the European Commission presented its strategy for data and Artificial Intelligence. The EC altogether delivered four papers: a White Paper on Artificial Intelligence,¹²⁸⁶ a report on the safety and liability implications of Artificial Intelligence, the Internet of Things and robotics,¹²⁸⁷ as well as two communications, one on Europe's digital future¹²⁸⁸ and one on the European strategy for data.¹²⁸⁹ Despite the fact that EC's statements do not constitute a legal regime for AI, they nonetheless provide guidance on the European Commission's priorities and potential next steps. They furthermore show that the Commission aims at positioning the EU as a digital leader in terms of both, trustworthy AI and the wider data economy.¹²⁹⁰ With regard to the future regulation of AI, the EC wants to pursue a uniform approach to avoid divergent member state requirements which may lead barriers within EU's single market.¹²⁹¹ The EC's White Paper is acknowledging that AI may involve a variety of risks, for example for fundamental rights, privacy protection and non-discrimination as well as risks for safety and the effective functioning of the liability regime,¹²⁹² and that is why the EC wants high-risk systems to meet security, privacy and fairness requirements before they go live by identifying high-risk sectors and applications in advance. The European Commission consequently acknowledges the importance of the seven key requirements that have been identified in HLEG's guidelines:¹²⁹³

- I. **"Human agency and oversight.**¹²⁹⁴ *The principle of human agency is that a human should always be in ultimate control of an AI system. For example, an AI vehicle would not start without a human inserting a key and the vehicle can be manually overridden at any point if it malfunctions. The autonomous vehicle sector where the handover of control from human to machine and back again is one of main areas of contention and rife with practical problems,*
- II. **Technical robustness and safety:** *The results from AI systems should be reproducible, predictable and accurate and AI systems should also be protected against cyberattacks,*
- III. **Privacy and data governance:** *AI systems typically 'learn' from enormous sets of data from which they deduce relationships between the variables in such data. The data may be personal, and AI may be able to infer gender, sexual orientation, race, political and religious views. The sensitivity of this data is obvious and so it is incumbent on developers to ensure that AI systems are do not misuse this data or leak this information,*
- IV. **Transparency:** *The inner workings of a AI system should be clearly explainable to all parties so that everyone (even those of a non-technical background) can understand the basic principles to which they work,*
- V. **Diversity non-discrimination and fairness:** *An AI system is only as good as the data it uses to learn. If the data fed to the system is inherently biased or not representative then the AI system will make biased and discriminatory decisions. It is therefore necessary to have controls on the quality of the data used,*
- VI. **Societal and environmental wellbeing:** *AI systems should be used to benefit society as a whole rather than individuals. In addition, sustainability and ecological impact should be taken into account when developing AI systems, and*
- VII. **Accountability:** *If an AI system malfunctions and potentially causes harm then it should be possible to trace the manufacturers of the AI system to bring them to justice. This is a difficult task because there are many parties involved in the creation of AI systems from the beginning to the end of the supply chain. AI systems should be traceable and should be audited at each stage of the supply chain in order to ensure their compliance."*

The EC moreover elaborates on specific requirements for certain AI applications such as "those used for purposes of (remote) biometric identification", however, the latter has been criticized, because the requirements are weaker than the ones suggested in a previous version of the paper which suggested a moratorium on facial recognition in public spaces for five years.¹²⁹⁵ The EC was also criticized for the

fact that the paper’s AI guidelines only address high-risk technologies (e.g. biometrics, surveillance) or certain industries (e.g. energy) but not consumer-relevant (e.g. advertising) technology.¹²⁹⁶

6.2.3.2. Declaration on European Digital Rights and Principles

In late 2022, the European Commission, European Parliament and the Council of the European Union reached a political agreement on the European declaration on digital rights and principles.¹²⁹⁷ The declaration aims to set out the EU approach to the digital transformation to foster growth, prosperity, competitiveness as well as security and societal well-being, and the declaration furthermore aims at complementing existing rights under the General Data Protection Regulation or the Charter of Fundamental Rights and underlines the importance of freedom of choice in interactions with algorithms and AI systems to ensure a “fair digital environment” by putting people at the center.¹²⁹⁸ The six principles contained in the declaration are:¹²⁹⁹ putting people and their rights at the centre of the digital transformation; supporting solidarity and inclusion; ensuring freedom of choice online; fostering participation in the digital public space; increasing safety, security and empowerment of individuals; promoting the sustainability of the digital future.

6.2.4. HUMANE AI Net

Together with a network of more than 50 academic and industrial partners, the European Commission launched HUMANE AI Net to facilitate “a European brand of trustworthy, ethical AI that enhances Human capabilities and empowers citizens and society to effectively deal with the challenges of an interconnected globalized world.”¹³⁰⁰ The initiative originated in Germany at the German Research Center for Artificial Intelligence¹³⁰¹ and engages in numerous micro projects such as Defining AI for regulatory and policy purposes, Algorithmic Bias, Strategies for Adaptive User Interfaces or Ethical

Chat-Bots and published a series of reports on reports on human-centered AI, including a research roadmap¹³⁰² and policy recommendations.¹³⁰³ HUMANE AI Net’s research agenda for human-centered AI is built on 5 pillars: societal awareness; legal and ethical bases for responsible AI; human-AI collaboration and interaction; multimodal perception and modeling as well as human-in-the-loop Machine Learning, reasoning, and planning.¹³⁰⁴

6.2.5. Council of Europe Commissioner for Human Rights recommendation

In 2019, the Council of Europe’s Commissioner for Human Rights issued a recommendation¹³⁰⁵ which explains that “finding the right balance between technological development and human rights protection is an urgent matter” given the fact that AI-driven applications are nowadays part of everyday life. The document is aimed at Council of Europe (COE) Member States; however, the findings concern anyone dealing with the design, development, or implementation of AI. The document¹³⁰⁶ names the following ten steps to protect human rights and unbox Artificial Intelligence:

- I. “Human rights impact assessment,*
- II. Public consultation,*
- III. Obligation of Member States to facilitate the implementation of human rights standards in the private sector,*
- IV. Information and transparency,*
- V. Independent oversight,*
- VI. Non-discrimination and equality,*
- VII. Data protection and privacy,*
- VIII. Freedom of expression, assembly and association, and the right to work*
- IX. Remedies,*
- X. Promotion of AI-literacy.”*

¹³⁰² Details on HUMANE AI: Toward AI systems that augment and empower humans by understanding us, our society, and the world around us are available at <https://www.humane-ai.eu/wp-content/uploads/2020/01/D4.1-v3.pdf>. Retrieved October 15, 2021.

¹³⁰⁵ The Council of Europe’s Commissioner for Human Rights recommendation: Unboxing Artificial Intelligence – 10 steps to protect human rights. Recommendation published May 2019, available at <https://rm.coe.int/unboxing-artificial-intelligence-10-steps-to-protect-human-rights-reco/1680946e64>. Retrieved October 15, 2021.

¹³⁰⁶ The document includes a checklist with “Dos” and “Don’ts” with actions for each key area to serve as guidance when it comes to operationalizing recommendations.

It is important that the Council of Europe Commissioner for Human Rights recommendation stresses human rights impact assessments, because we are at a turning point for the future of algorithmic accountability: HRIAs are a core element of many recommendations in the frameworks of ongoing AI regulatory debates, including regulatory proposals in many jurisdictions, but even though there is consensus that human rights impact assessments could be good algorithmic governance mechanism, there is no standardized process for conducting such assessments that can be considered truly accountable.¹³⁰⁷

6.2.6. Council of Europe recommendations

6.2.6.1. Recommendation for a Convention on AI, Human Rights, Democracy, and the Rule of Law

In August 2022, the European Commission issued its recommendation¹³⁰⁸ for a Council Decision Authorizing the Opening of Negotiations on behalf of the European Union for a Council of Europe Convention on Artificial Intelligence (AI), Human Rights, Democracy, and the Rule of Law. The recommendation notes that there is a very significant overlap between the future CoE convention on AI and the proposed AI Act in terms of scope, nature, and content. Consequently, the recommendation underlines the importance of further negotiations in such a way as to ensure the consistency and uniformity of (future) EU rules for AI. The European Data Protection Supervisor believes that the Convention is an important opportunity to complement the European Commission’s proposed Artificial Intelligence Act and that this initiative is an “opportunity to develop the first legally binding international instrument on Artificial Intelligence according to EU standards and values on human rights, democracy and the rule of law.”¹³⁰⁹ However, the EDPS also made the following key recommendations on the EU’s negotiating directives for the Convention.¹³¹⁰ The EDPS is of the opinion that AI systems that pose unacceptable risks to individuals should be prohibited by default, for example, AI systems that

Retrieved December 31, 2022.

¹³¹⁰ European Data Protection Supervisor Opinion 20/2022 on the recommendation for a Council decision authorizing the opening of negotiations on behalf of the European Union for a Council of Europe convention on artificial intelligence, human rights, democracy and the rule of law. Opinion published October 13 2022, available at https://edps.europa.eu/press-publications/press-news/press-releases/2022/ai-convention-stronger-protection-fundamental-rights-necessary_en. Retrieved December 31, 2022.

affect individuals' rights to human dignity, social scoring, biometric identification of individuals in public spaces, or the categorization of individuals based on biometric data (e.g., ethnicity) or according to their perceived emotions. On top of these conditions that shall be explicitly applied in the negotiating directives, the EDPS furthermore recommends the monitoring of AI systems, and the introduction of procedural safeguards to ensure that AI systems are transparent in the sense of clear explicability to both, regulators and individuals, and that they can be audited regularly to limit risks that such tools may present to protect individuals that may be affected by the use of AI systems.

6.2.6.2. Recommendations on Human Rights Impacts of Algorithmic Systems

The Council of Europe, the leading international organization for the protection of human rights as set forth in the European Convention on Human Rights¹³¹¹ issued guidelines on how COE Member States – currently 47 out of which 27 are EU Member States – should legislate to make sure that human rights are addressed when Artificial Intelligence is used.¹³¹² COE's recommendations are similar to HLEG's Ethics Guidelines for Trustworthy AI, but the interesting thing about COE's recommendations is that two sets of guidelines have been issued, one for the private sector which may serve for orientation purposes in the sense of best practices, and one for the public sector that could potentially serve as guidance for future legislation. COE's guidelines on addressing the human rights impacts of algorithmic systems name the following general principles (obligations) for states with respect to the protection and promotion of human rights and fundamental freedoms in the context of algorithmic systems:¹³¹³

- I. **“Research, innovation, public awareness¹³¹⁴** (including rights-promoting technology, human-centric and sustainable innovation as well as independent research),
- II. **Precautionary measures** (including impact assessments, staff management and interaction of systems / integrations),
- III. **Legislation** (including ongoing review, democratic participation and awareness, institutional framework),
- IV. **Transparency, accountability, and effective remedies** (including contestability, oversight),
- V. **Data management** (including informational self-determination, infrastructure),
- VI. **Analysis and modelling** (including safeguards, evaluation, testing).”

¹³¹¹ Further background information on the Council of Europe is available at the Council's website <https://www.coe.int/en/web/about-us>. Retrieved October 15, 2021.

¹³¹² Council of Europe's recommendation on the human rights impacts of algorithmic systems adopted April 8 2020, and is available at https://search.coe.int/cm/pages/result_details.aspx?objectid=09000016809e1154. Retrieved October 15, 2021.

¹³¹³ COE's guidelines on addressing the human rights impacts of algorithmic systems published April 8 2020, available at https://search.coe.int/cm/pages/result_details.aspx?objectid=09000016809e1154. Retrieved October 15, 2021.

¹³¹⁴ Bold means emphasis added.

Private sector actors shall consider with the following general principles in order to comply with human rights and fundamental freedoms in the context of algorithmic systems:

- I. *“Transparency, accountability, and effective remedies,*
- II. *Appropriate privacy settings and consent rules,*
- III. *Responsibility to respect human rights,*
- IV. *Contestability and effective remedies,*
- V. *Avoidance of discrimination,*
- VI. *Data quality and security.”*

6.2.6.3. Human Rights, Democracy and Rule of Law Impact Assessment / Framework

The Council of Europe’s Ad Hoc Committee on Artificial Intelligence (CAHAI)¹³¹⁵ also proposed to introduce a non-binding mechanism to allow for a “Human Rights, Democracy and Rule of Law Impact Assessment” (HUDERIA) with the following main elements:¹³¹⁶

- I. *“Risk Identification: Identification of relevant risks for human rights, democracy and the rule of law;*
- II. *Impact Assessment: Assessment of the impact, taking into account the likelihood and severity of the effects on those rights and principles;*
- III. *Governance Assessment: Assessment of the roles and responsibilities of duty-bearers, rights holders and stakeholders in implementing and governing the mechanisms to mitigate the impact;*
- IV. *Mitigation and Evaluation: Identification of suitable mitigation measures and ensuring a continuous evaluation.”*

The Human Rights, Democracy and Rule of Law Impact Assessment was not the only topic CAHAI had been working on; its policy and development group was also working on a “Rights, Democracy, and the “Rule of Law Assurance Framework for AI Systems” (HUDERAF), which “combines the procedural requirements for principles-based human rights due diligence with the governance mechanisms needed to set up technical and socio-technical guardrails for responsible and trustworthy AI innovation practices. Its purpose is to provide an accessible and user-friendly set of mechanisms for facilitating compliance with a binding legal framework for Artificial Intelligence, based on the Council of Europe’s standards on human rights, democracy, and the rule of law, and to ensure that AI innovation

¹³¹⁵ The CAHAI fulfilled its mandate (2019-2021) and has been succeeded by the Committee on Artificial Intelligence (CAI), see <https://www.coe.int/en/web/artificial-intelligence/cahai-1>. Retrieved July 25 2022.

projects are carried out with appropriate levels of public accountability, transparency, and democratic governance.”¹³¹⁷ HUDERAF encompasses four interrelated elements: a preliminary context-based risk analysis, the stakeholder engagement process, the HUDERIA and finally, a “Human Rights, Democracy, and Rule of Law Assurance Case” (HUDERAC) which “enables AI project teams to build a structured argument that provides demonstrable assurance to stakeholders that claims about the attainment of goals established in the HUDERIA and other HUDERAF governance processes are warranted given available evidence.”¹³¹⁸

6.2.7. European Parliament’s resolutions and initiatives

6.2.7.1. Resolution on Civil Law Rules on Robotics

The European Parliament’s Legal Affairs Committee dealt with issues surrounding the liability in robotics and published a study to evaluate and analyze a number of future European civil law rules in robotics¹³¹⁹ from a legal and ethical perspective. EP furthermore issued a resolution on Civil Law Rules on Robotics¹³²⁰ which deals, amongst other things, with protecting humans against the risk of harm and manipulation by robots and discusses the establishment of a mandatory insurance scheme for specific categories of robots as well as the creation of a general fund for all intelligent autonomous robots or an individual fund for each category and the establishment of a specific legal status for robots, so that autonomous robots are responsible for any damage they cause.¹³²¹ The European Parliament suggests that robots should not be given a legal personality, even if robots interact with third parties independently.¹³²² The European Parliament continued its work and issued three further resolutions:

Retrieved October 15, 2021.

6.2.7.2. Resolution on a Civil Liability Regime for AI

The European Parliament issued a resolution on a civil AI liability to address key issues like insurances, operator liability and different liability rules for different risks: the European Parliament suggested that those operating high-risk AI should be strictly liable for any resulting damage, material and immaterial harm.¹³²³ The EP called for a harmonized legal framework for civil liability claims to prevent potential misuses of AI-systems¹³²⁴ and the European Parliament also dealt with the issue of Artificial intelligence and civil law liability rules for drones.¹³²⁵ Another factor to consider is the fact that the Product Liability Directive has been in place for almost 40 years now, meaning that new challenges arising from AI may not be properly reflected. While the European Commission expressed its belief that the Directive is still fit for purpose,¹³²⁶ a new proposal for product liability has been published to address such issues.¹³²⁷

6.2.7.3. Resolution on Intellectual Property Rights

The European Parliament moreover published a resolution on intellectual property rights:¹³²⁸ the EP highlighted the benefits of AI development, and given key importance of these rights, the EP stressed the need for a common AI legislation to avoid massive litigation and called on the Commission to carry out an impact assessment regarding the protection of intellectual property rights in the context of AI and related technologies. Furthermore, the European Parliament once more underlined its position that robots or AI technologies should not have legal personality and that only humans have the ownership of intellectual property rights.

6.2.7.4. Resolution on Ethical Aspects of Artificial Intelligence

The European Parliament also issued a resolution on the ethical aspects of AI and provided recommendations about the ethics needed in the framework of Artificial Intelligence.¹³²⁹ the EP stressed that AI shall be tailored to human needs, values-based and built on safety, transparency as well as accountability and tailored to human needs and shall provide for privacy, sustainability, social responsibility as well as non-discrimination and workers' rights so that AI is always at the service of humans.

6.2.7.5. Special Committee on Artificial Intelligence in the digital age

Last, but not least, the EP established a special committee on Artificial Intelligence in 2020 called AIDA with the goal of setting out a long-term EU roadmap on AI to “study the impact and challenges of rolling out AI, identify common EU-wide objectives, and propose recommendations on the best ways forward.”¹³³⁰ AIDA's 12-month mandate will pursue a horizontal approach, take third-country approaches to AI into consideration, organize stakeholder workshops and summarize their findings and recommendations in a final report.

6.3. Intergovernmental cooperation

Apart from EU's High level Expert Group on Artificial Intelligence (HLEG)¹³³¹ that delivered Ethics Guidelines for trustworthy AI and UNESCO's Ad Hoc Expert Group (AHEG)¹³³² which published a recommendation on the ethics of artificial intelligence, there are further intergovernmental activities that are worthwhile mentioning: OECD's Network of Experts on AI (ONE AI)¹³³³ which launched the OECD

¹³²⁹ European Parliament resolution with recommendations to the Commission on a framework of ethical aspects of Artificial Intelligence, robotics and related technologies (2020/2012(INL) published 20 October 2020, available at https://www.europarl.europa.eu/doceo/document/TA-9-2020-0275_EN.html#:~:text=European%20Parliament%20resolution%20of%202020%20October%202020%20with,artificial%20intelligence%2C%20robotics%20and%20related%20technologies%20%282020%2F2012%20%28INL%29%29. Retrieved October 15, 2021.

AI Policy Observatory¹³³⁴ and is working on the classification of AI to provide a framework for assessing and classifying AI systems according to their impact.¹³³⁵ The Global Partnership on AI (GPAI) was founded by 15 countries from all over the globe to “bring together engaged minds and expertise from science, industry, civil society, governments, international organizations and academia to foster international cooperation”.¹³³⁶ In summary, HLEG’s and AHEG’s focus area is AI Ethics, ONE AI’s focus is AI classification, whereas GPAI is also concerned with responsible AI and the future of work.

6.4. Expert Guidelines, civil society and multistakeholder recommendations

6.4.1. Universal Guidelines for Artificial Intelligence

The Universal Guidelines for Artificial Intelligence (UGAI)¹³³⁷ have been announced at the 2018 International Data Protection and Privacy Commissioners Conference: more than 150 experts and 40 non-governmental organizations representing 30 countries around the world endorsed the guidelines which some consider a “landmark policy”¹³³⁸ – for good reason: apart from much-repeated provisions like accountability, transparency and fairness, those guidelines follow a comprehensive approach to protect individuals’ rights, and they contain more far-reaching obligations, ranging from existing (but neglected) principles like data quality and accuracy to new requirements like the prohibition of secret profiling and national scoring, making the true operators of an AI system known and a termination obligation when an institution loses control of an AI system. The UGAI require the following:

- I. **“Right to transparency:**¹³³⁹ *all individuals have the right to know the basis of an AI decision that concerns them. This includes access to the factors, the logic, and techniques that produced the outcome.*
- II. **Right to human determination:** *all individuals have the right to a final determination made by a person.*

¹³³⁴ Background information on OECD’s AI Policy Observatory is available at <https://oecd.ai/about/#:~:text=The%20OECD%20AI%20Policy%20Observatory%20%28OECD.AI%29%20builds%20on,basis%20for%20the%20G20%20AI%20Principles%20endorsed%20>. Retrieved October 15, 2021.

¹³³⁹ Bold means emphasis added.

- III. **Identification obligation:** *the institution responsible for an AI system must be made known to the public.*
- IV. **Fairness obligation:** *institutions must ensure that AI systems do not reflect unfair bias or make impermissible discriminatory decisions.*
- V. **Assessment and accountability obligation:** *an AI system should be deployed only after an adequate evaluation of its purpose and objectives, its benefits, as well as its risks. Institutions must be responsible for decisions made by an AI system.*
- VI. **Accuracy, reliability, and validity obligations:** *institutions must ensure the accuracy, reliability, and validity of decisions.*
- VII. **Data quality obligation:** *institutions must establish data provenance, and assure quality and relevance for the data input into algorithms.*
- VIII. **Public safety obligation:** *institutions must assess the public safety risks that arise from the deployment of AI systems that direct or control physical devices, and implement safety controls.*
- IX. **Cyber-security obligation:** *institutions must secure AI systems against cybersecurity threats.*
- X. **Prohibition on secret profiling:** *no institution shall establish or maintain a secret profiling system.*
- XI. **Prohibition on unitary scoring:** *no national government shall establish or maintain a general-purpose score on its citizens or residents.*
- XII. **Termination obligation:** *an institution that has established an AI system has an affirmative obligation to terminate the system if human control of the system is no longer possible.”*

6.4.2. Future of Life Institute: Asilomar AI Principles

The Future of Life Institute hosted a conference in 2017 where numerous researchers and thought leaders in law, economics, ethics as well as philosophy met to discuss beneficial Artificial Intelligence.¹³⁴⁰ The following twenty-three principles, called the AI Asilomar Principles, have been developed during the meeting:

“Research Issues¹³⁴¹

- I. **Research Goal:** *The goal of AI research should be to create not undirected intelligence, but beneficial intelligence.*

¹³⁴⁰ Background information on the Asilomar AI Principles is available at the Future of Life’s website, available at <https://futureoflife.org/ai-principles/>. Retrieved October 15, 2021.

¹³⁴¹ Bold means emphasis added.

- II. **Research Funding:** Investments in AI should be accompanied by funding for research on ensuring its beneficial use, including thorny questions in computer science, economics, law, ethics, and social studies, such as:
- How can we make future AI systems highly robust, so that they do what we want without malfunctioning or getting hacked?
 - How can we grow our prosperity through automation while maintaining people's resources and purpose?
 - How can we update our legal systems to be fairer and more efficient, to keep pace with AI, and to manage the risks associated with AI?
 - What set of values should AI be aligned with, and what legal and ethical status should it have?

III. **Science-Policy Link:** There should be constructive and healthy exchange between AI researchers and policy makers.

IV. **Research Culture:** A culture of cooperation, trust, and transparency should be fostered among researchers and developers of AI.

V. **Race Avoidance:** Teams developing AI systems should actively cooperate to avoid corner-cutting on safety standards.

Ethics and Values

VI. **Safety:** AI systems should be safe and secure throughout their operational lifetime, and verifiably so where applicable and feasible.

VII. **Failure Transparency:** If an AI system causes harm, it should be possible to ascertain why.

VIII. **Judicial Transparency:** Any involvement by an autonomous system in judicial decision-making should provide a satisfactory explanation auditable by a competent human authority.

IX. **Responsibility:** Designers and builders of advanced AI systems are stakeholders in the moral implications of their use, misuse, and actions, with a responsibility and opportunity to shape those implications.

X. **Value Alignment:** Highly autonomous AI systems should be designed so that their goals and behaviors can be assured to align with human values throughout their operation.

XI. **Human Values:** AI systems should be designed and operated be compatible with ideals of human dignity, rights, freedoms, and cultural diversity.

XII. **Personal Privacy:** People should have the right to access, manage and control the data they generate, given AI systems' power to analyze and utilize that data.

XIII. **Liberty and Privacy:** The application of AI to personal data must not unreasonably curtail people's real or perceived liberty.

- XIV. **Shared Benefit:** *AI technologies should benefit and empower as many people as possible.*
- XV. **Shared Prosperity:** *The economic prosperity created by AI should be shared broadly, to benefit all of humanity.*
- XVI. **Human Control:** *Humans should choose how and whether to delegate decisions to AI systems, to accomplish human-chosen objectives.*
- XVII. **Non-subversion:** *The power conferred by control of highly advanced AI systems should respect and improve, rather than subvert, the social and civic processes on which the health of society depends.*
- XVIII. **AI Arms Race:** *An arms race in lethal autonomous weapons should be avoided.*

Longer-term Issues

- XIX. **Capability Caution:** *There being no consensus, we should avoid strong assumptions regarding upper limits on future AI capabilities.*
- XX. **Importance:** *Advanced AI could represent a profound change in the history of life on Earth and should be planned for and managed with commensurate care and resources.*
- XXI. **Risks:** *Risks posed by AI systems, especially catastrophic or existential risks, must be subject to planning and mitigation efforts commensurate with their expected impact.*
- XXII. **Recursive Self-Improvement:** *AI systems designed to recursively self-improve or self-replicate in a manner that could lead to rapidly increasing quality or quantity must be subject to strict safety and control measures.*
- XXIII. **Common Good:** *Super-intelligence should only be developed in the service of widely shared ethical ideals, and for the benefit of all humanity rather than one state or organization.”*

6.4.3. ACM’s Statement on Algorithmic Transparency and Accountability

In 2017, the Association for Computing Machinery (ACM) issued a statement on Algorithmic Transparency and Accountability¹³⁴² which included seven principles designed to be consistent with ACM’s Code of Ethics¹³⁴³ and to address potential harmful bias¹³⁴⁴ the use of AI may involve:

¹³⁴² ACM statement on Algorithmic Transparency and Accountability published January 12 2017, available at https://www.acm.org/binaries/content/assets/public-policy/2017_usacm_statement_algorithms.pdf. Retrieved October 15, 2021.

¹³⁴³ ACM’s Code of Ethics published in 2018, available at <https://ethics.acm.org/>. Retrieved October 15, 2021.

¹³⁴⁴ Renee Dopplick: New Statement on Algorithmic Transparency and Accountability by ACM U.S. Public Policy Council. Article published January 14 2017, available at <https://techpolicy.acm.org/2017/01/new-statement-on-algorithmic-transparency-and-accountability-by-acm-u-s-public-policy-council/>. Retrieved October 15, 2021.

- I. **Awareness:**¹³⁴⁵ Owners, designers, builders, users, and other stakeholders of analytic systems should be aware of the possible biases involved in their design, implementation, and use and the potential harm that biases can cause to individuals and society.
- II. **Access and redress:** Regulators should encourage the adoption of mechanisms that enable questioning and redress for individuals and groups that are adversely affected by algorithmically informed decisions.
- III. **Accountability:** Institutions should be held responsible for decisions made by the algorithms that they use, even if it is not feasible to explain in detail how the algorithms produce their results.
- IV. **Explanation:** Systems and institutions that use algorithmic decision-making are encouraged to produce explanations regarding both the procedures followed by the algorithm and the specific decisions that are made. This is particularly important in public policy contexts.
- V. **Data Provenance:** A description of the way in which the training data was collected should be maintained by the builders of the algorithms, accompanied by an exploration of the potential biases induced by the human or algorithmic data-gathering process. Public scrutiny of the data provides maximum opportunity for corrections. However, concerns over privacy, protecting trade secrets, or revelation of analytics that might allow malicious actors to game the system can justify restricting access to qualified and authorized individuals.
- VI. **Auditability:** Models, algorithms, data, and decisions should be recorded so that they can be audited in cases where harm is suspected.
- VII. **Validation and Testing:** Institutions should use rigorous methods to validate their models and document those methods and results. In particular, they should routinely perform tests to assess and determine whether the model generates discriminatory harm. Institutions are encouraged to make the results of such tests public.”

6.4.4. The Toronto Declaration

The so-called Toronto Declaration¹³⁴⁶ was announced by coalition of digital and human rights groups, including e.g., Human Rights Watch and Amnesty International. The declaration was the outcome of the RightsCon conference and, unlike many other guidelines and statements that discussed ethical aspects of Artificial Intelligence, the Toronto Declaration aims at embedding basic principles of equality and non-discrimination in Machine Learning.¹³⁴⁷ It named 59 topics and action points altogether that

¹³⁴⁵ Bold means emphasis added.

¹³⁴⁶ Toronto Declaration published May 16 2018, available at https://www.accessnow.org/cms/assets/uploads/2018/08/The-Toronto-Declaration_ENG_08-2018.pdf. Retrieved October 15, 2021.

¹³⁴⁷ Russell Brandom: New Toronto Declaration calls on algorithms to respect human rights. Article published May 16 2018, available at <https://www.theverge.com/2018/5/16/17361356/toronto-declaration-machine-learning-algorithmic-discrimination-rightscon>. Retrieved October 15, 2021.

emphasizes the importance of not only transparency and accountability, but also the necessity of human oversight and the right to effective remedy and above all, the right to equality and non-discrimination which means that whenever AI is applied, risks and potential discriminatory outcomes have to be considered so that human rights are respected. Given that algorithms advance in capability and increase in use in nearly all aspects of life,¹³⁴⁸ from employment and education to policing and criminal justice, AI and Machine Learning may impact a variety of human rights such as the right to privacy, the freedom of expression, participation in cultural life, the right to remedy and the right to life,¹³⁴⁹ the Toronto declaration therefore demands that states have the obligation to promote, protect and respect human rights and that private sector actors have a responsibility to respect human rights.

6.4.5. Montreal declaration for a responsible development of Artificial Intelligence

The Montreal Declaration was announced at the conclusion of the 2017 Forum on socially responsible development of AI held in Montreal and aims to promote public debate and “encourage a progressive and inclusive orientation to the development of Artificial Intelligence”.¹³⁵⁰ The Montreal Declaration for responsible AI development has three main objectives: to provide an open forum for discussion for AI to achieve equitable, inclusive, and ecologically sustainable AI, to foster the development of an ethical framework for AI, and to provide guidance for this major digital transition for the benefit of all by applying the following basic principles:

- I. **Well-being principle:**¹³⁵¹ *the development and use of artificial intelligence systems (AIS) must permit the growth of the well-being of all sentient beings.*
- II. **Respect for autonomy principle:** *AIS must be developed and used while respecting people’s autonomy, and with the goal of increasing people’s control over their lives and their surroundings.*
- III. **Protection of privacy and intimacy:** *Privacy and intimacy must be protected from AIS intrusion and data acquisition and archiving systems (DAAS).*
- IV. **Solidarity principle:** *The development of AIS must be compatible with maintaining the bonds of solidarity among people and generations.*

¹³⁴⁸ Further details are provided in the preamble of the Toronto Declaration, available at https://www.accessnow.org/cms/assets/uploads/2018/08/The-Toronto-Declaration_ENG_08-2018.pdf. Retrieved October 15, 2021.

¹³⁵⁰ Montreal Declaration published 2018, available at <https://www.montrealdeclaration-responsibleai.com/the-declaration>. Retrieved October 15, 2021.

¹³⁵¹ Bold means emphasis added.

- V. **Democratic participation principle:** *AIS must meet intelligibility, justifiability, and accessibility criteria, and must be subjected to democratic scrutiny, debate, and control.*
- VI. **Equity principle:** *The development and use of AIS must contribute to the creation of a just and equitable society.*
- VII. **Diversity and inclusion principle:** *The development and use of AIS must be compatible with maintaining social and cultural diversity and must not restrict the scope of lifestyle choices or personal experiences.*
- VIII. **Prudence principle:** *The development and use of AIS must be compatible with maintaining social and cultural diversity and must not restrict the scope of lifestyle choices or personal experiences.*
- IX. **Responsibility principle:** *The development and use of AIS must not contribute to lessening the responsibility of human beings when decisions must be made.*
- X. **Sustainable development principle:** *The development and use of AIS must be carried out so as to ensure a strong environmental sustainability of the planet.”*

6.4.6. FAT/ML’s Principles for Accountable Algorithms

Fairness, Accountability, and Transparency in Machine Learning (FAT/ML) is an initiative that brings together “a growing community of researchers and practitioners concerned with fairness, accountability, and transparency in Machine Learning”.¹³⁵² FAT/ML discusses the idea that bias might inadvertently be encoded into automated decisions if the complexity of Machine Learning either reduces or replaces the needed justification for AI decisions to “the algorithm made me do it”.¹³⁵³ FAT/ML is engaged in a series of projects and organizes events that deal with various aspects that have to be obeyed when AI is applied such as Machine Learning and the law, algorithmic bias, explicability of AI decisions or privacy-aware data mining.¹³⁵⁴ FAT/ML also issued Principles for Accountable Algorithms, and they do not simply conclude with these principles, but furthermore provide a “Social Impact Statement for Algorithms” which shall serve as a guiding structure and which shall be used and revisited during all phases of the development process, i.e. design stage, pre-launch and post-launch to stress that only a repeated examination of the requirements ensures adherence to these principles. The Social Impact Statement should (at least) address their corresponding questionnaire that refers to specific steps that can be taken to address the requirements outlined in their principles. For transparency purposes, they

¹³⁵² This includes representatives from Microsoft, Google, and universities.

¹³⁵³ Background information on the Fairness, Accountability, and Transparency in Machine Learning initiative is available at their website <https://www.fatml.org/>. Retrieved October 15, 2021.

¹³⁵⁴ Details on FAT/ML’s areas of work are available at <https://www.fatml.org/resources/relevant-events>. Retrieved October 15, 2021.

propose that the statement shall be published so that the public can voice expectations for social impact of the system. FAT/ML’s Principles for Accountable Algorithms¹³⁵⁵ read as follows:

- I. **“Responsibility.”**¹³⁵⁶ *Make available externally visible avenues of redress for adverse individual or societal effects of an algorithmic decision system, and designate an internal role for the person who is responsible for the timely remedy of such issues.*
- II. **Explainability:** *Ensure that algorithmic decisions as well as any data driving those decisions can be explained to end-users and other stakeholders in non-technical terms.*
- III. **Accuracy:** *Identify, log, and articulate sources of error and uncertainty throughout the algorithm and its data sources so that expected and worst-case implications can be understood and inform mitigation procedures.*
- IV. **Auditability:** *Enable interested third parties to probe, understand, and review the behavior of the algorithm through disclosure of information that enables monitoring, checking, or criticism, including through provision of detailed documentation, technically suitable APIs, and permissive terms of use.*
- V. **Fairness:** *Ensure that algorithmic decisions do not create discriminatory or unjust impacts when comparing across different demographics (e.g., race, sex, etc.).”*

6.4.7. IAF’s Fair Processing Principles and Fair and Open Use Act

The Information Accountability Foundation (IAF) is a global information policy think tank that focuses on “effective information governance systems to facilitate information-driven innovation respectful of people’s fundamental right to fair processing”.¹³⁵⁷ Despite the fact that IAF’s Fair Processing Principles¹³⁵⁸ have not been written to specifically address Big Data activities or Artificial Intelligence applications, the document is valuable guidance in the area of AI as it addresses key issues of innovative technology. IAF lists the following key elements needed to ensure data is processed and used in a legitimate and responsible manner:

“Individual Rights

- I. **Transparency,**
- II. **Beneficial purposes,**

¹³⁵⁵ See FAT/ML’s Principles for Accountable Algorithms, available at <https://www.fatml.org/resources/principles-for-accountable-algorithms>. Retrieved October 15, 2021.

¹³⁵⁶ Bold means emphasis added.

¹³⁵⁷ Background information on the Information Accountability Foundation is available at <https://informationaccountability.org/>. Retrieved October 15, 2021.

¹³⁵⁸ IAF’s Fair Processing Principles published on January 1 2019, available at <https://informationaccountability.org/publications/>. Retrieved October 15, 2021.

- III. *Access and redress,*
- IV. *Engagement and appropriate control.*

Accountable Data Stewardship

- V. *Assessed and mitigated impacts,*
- VI. *Legitimate and contextual uses,*
- VII. *Onward responsibility,*
- VIII. *Remediation,*
- IX. *Oversight,*
- X. *Security.”*

The Information Accountability Foundation moreover issued the Fair and Open Use Act¹³⁵⁹ which is a model for privacy legislation that focuses on fair processing: IAF stresses that lessons learned from GDPR and other privacy legislation show that it is “time to place the onus on the organization to first and foremost achieve fair processing rather than placing the burden on the consumer.”¹³⁶⁰ IAF’s model legislation is based on risk assessment to capture and control potentially bad outcomes and stresses the importance of effective information governance; it wants to break the paradigm that legacy systems placed on the individual instead of organizational responsibility, consequently, IAF’s model legislation flips that order¹³⁶¹ since “the old privacy paradigm that individual control is the keystone for effective fair processing is no longer fit for its purpose.”¹³⁶² IAF is convinced that legislation should target risks, and not stick to (the exercise of) individual’s rights, because organizations that get value from data must also be responsible stewards of that data.¹³⁶³ IAF builds on the FCRA’s concept of permissible purpose and requires that personal data only be processed for specific legitimate uses. IAF presents the following eleven legitimate uses:¹³⁶⁴ advertising or marketing purposes (subject to conditions), compliance with a

¹³⁵⁹ IAF’s Fair and Open Use Act published May 25 2021, available at <https://secureservercdn.net/192.169.221.188/b1f.827.myftpupload.com/wp-content/uploads/2021/05/FAIR-and-OPEN-USE-Act-May-26-2021-1.pdf?time=1623678345>. Retrieved October 15, 2021.

legal obligation, protection against unlawful activity, requested product or service, affirmative express consent, routine business processes, public safety and health, knowledge discovery, information security, as well as journalism and research.” On the one hand, this should provide for a “forward looking risk-based model legislation”,¹³⁶⁵ on the other hand, it should also allow for innovation by enabling controllers to use data and knowledge they extract from information. Interestingly, IAF distinguishes between several types of data, but not in the traditional sense of sensitive and non-sensitive personal data, but depending on the source and origin of information, that is: personal data – provided data – observed data – inferred data – third party provided data. A similar categorization of data is contained in Microsoft’s Online Services Data Processing Addendum¹³⁶⁶ which names the following types of data: “provided data” in the context of customer, support and professional services data; “collected or obtained data” is used for so-called diagnostic data, and “generated or derived data,” which refers to service generated data. This distinction is not just a new perspective on types of information or data sets, but significant insofar as it may draw the line between (joint?) controllers.¹³⁶⁷ As a matter of fact, such a categorization seems to be needed, because it is naïve to believe that whatever an individual provides as information, this is not the basis of subsequent processing operations, but only the starting point: in many cases “customer provided data” is likely to be the smallest portion of information, be it in the banking sector where screenings against various sanction lists are mandatory for compliance reasons¹³⁶⁸ or in e-commerce where background checks for fraud prevention purposes are based on legitimate interests: the user thinks his shopping cart is about placing an order, the vendor knows it’s where the individual risk profile is created, and depending on the circumstances, not only the user’s preferred payment method may be rejected, but the individual as such may get sorted out.¹³⁶⁹ So far, the focus within privacy legislation seems to be predominantly on content-level information, i.e. data which are visible in the frontend but this information is certainly the smaller volume of data in comparison to what is going on in the backend, and it would be interesting to know what the real ratio between these types of data is.

6.4.8. IEEE Ethically Aligned Design

The IEEE is a technical professional organization dedicated to the advancement of technology.¹³⁷⁰ Their “Global Initiative” deals with ethical considerations in Artificial Intelligence and autonomous systems (A/IS). Their comprehensive first edition of an Ethically Aligned Design (EAD)¹³⁷¹ is based on three pillars: universal human values, political self-determination as well as data agency and technical dependability. The latter means that A/IS shall operate reliably and safely and deliver services that can be trusted. IEEE’s initiative is different insofar as it does not only name principles, but explains how to incorporate those principles in practice and how those values can be embedded into systems. IEEE identified the following general principles for autonomous and intelligent systems:

- I. **“Human Rights:**¹³⁷² *A/IS shall be created and operated to respect, promote, and protect internationally recognized human rights.*
- II. **Well-being:** *A/IS creators shall adopt increased human well-being as a primary success criterion for development.*
- III. **Data Agency:** *A/IS creators shall empower individuals with the ability to access and securely share their data, to maintain people’s capacity to have control over their identity.*
- IV. **Effectiveness:** *A/IS creators and operators shall provide evidence of the effectiveness and fitness for purpose of A/IS.*
- V. **Transparency:** *The basis of a particular A/IS decision should always be discoverable.*
- VI. **Accountability:** *A/IS shall be created and operated to provide an unambiguous rationale for all decisions made.*
- VII. **Awareness of Misuse:** *A/IS creators shall guard against all potential misuses and risks of A/IS in operation.*
- VIII. **Competence:** *A/IS creators shall specify and operators shall adhere to the knowledge and skill required for safe and effective operation.”*

6.4.9. Women Leading in AI: 10 Principles for Responsible AI

Women Leading in AI intends to bring together female thinkers, scientists, academics, businesswomen and politicians to influence the future of AI tank of women leaders in AI. The network has been launched

¹³⁷² Bold means emphasis added.

in May 2018 at the London School of Economics and has a diverse membership from various backgrounds such as academia, computer programming, ethics, industry, law, politics, policy, privacy, or solutions architecture “giving us a critical mass of expertise that makes our voice listened to as the go-to people to talk about how AI impacts the real world.”¹³⁷³ Women Leading in AI believe that AI must be accountable, governed, responsible, transparent, and their Whitepaper on responsible AI names the following ten core principles:¹³⁷⁴

- I. *“Establish an **AI regulatory function** working alongside the Information Commissioner’s Office and Centre for Data Ethics – to audit algorithms, investigate complaints by individuals, issue notices and fines for breaches of GDPR and equality and human rights law, give wider guidance, spread best practice and ensure algorithms must be fully explained to users and open to public scrutiny.*
- II. *Introduce a new ‘**Certificate of Fairness for AI systems**’ alongside a ‘kite mark’ type scheme to display it. Criteria to be defined at industry level, similarly to food labelling regulations.*
- III. *Introduce mandatory **AIAs (Algorithm Impact Assessments)** for organisations employing AI systems that have a significant effect on individuals.*
- IV. *Introduce a mandatory requirement for **public sector organisations** using AI for particular purposes to **inform citizens** that decisions are made by machines, explain how the decision is reached and what would need to change for individuals to get a different outcome.*
- V. *Introduce a ‘**reduced liability**’ **incentive for companies** that have obtained a Certificate of Fairness to foster innovation and competitiveness.*
- VI. *To compel companies and other organisations to **bring their workforce with them** – by publishing the impact of AI on their workforce and offering retraining programmes for employees whose jobs are being automated.*
- VII. *Where no redeployment is possible, to compel companies to make a contribution towards a **digital skills fund** for those employees.*
- VIII. *To carry out a **skills audit** to identify the wide range of skills required to embrace the AI revolution.*
- IX. *To establish an **education and training programme** to meet the needs identified by the skills audit, including content on data ethics and social responsibility. As part of that, we recommend the set up of a solid, courageous and rigorous programme to **encourage young women and other underrepresented groups into technology.**“*

¹³⁷³ Background information on Women Leading in AI, their work, and goals is available at <https://womenleadinginai.org/about>. Retrieved June 8, 2022.

¹³⁷⁴ Women Leading in AI: 10 principles for responsible AI. Paper published in 2019, available at <https://womenleadinginai.org/report2019>. Retrieved June 8, 2022.

On top of requirements that are part of most recommendations such as, mandatory audits, and / or impact assessments, transparency, and the need for a regulatory approach, this Whitepaper focuses on two interesting aspects, one from an employee (i.e., affected individual) and one from a company (i.e., controller) perspective: the latter refers to the idea of a reduced liability for those data controllers that have obtained a “Certificate of Fairness” to further develop a responsible AI sector and at the same time demonstrate the company’s commitment to fairness. This sounds new but is similar like GDPR’s concept of certifications as a means of appropriate safeguards.¹³⁷⁵ The second aspect, the idea of a digital skills fund companies must contribute to if the use of AI leads to redeployment not being possible is important since AI may have a significant impact on workforce: for example, in Hungary, more than 40 % of the nation's current jobs can become automated.¹³⁷⁶ As regards potential negative consequences of AI in the employment context, it was even suggested that specific taxes shall be introduced for AI-performed tasks that have previously been performed by humans – because it could compensate for job loss – or because it could compensate for taxes lost as there is no income tax, social security tax, etc. paid when robots do the job.¹³⁷⁷

6.4.10. Centre for the Fourth Industrial Revolution & NITI Aayog

The Centre for the Fourth Industrial Revolution, which is hosted by the World Economic Forum,¹³⁷⁸ together with the Indian government’s policy think tank NITI Aayog partnered to design an ethics framework to ensure the responsible use of AI.¹³⁷⁹

- I. ***“Principle of Safety and Reliability:*** *AI should be deployed reliably as intended and sufficient safeguards must be placed to ensure the safety of relevant stakeholders. Risks to all stakeholders should be minimized and appropriate grievance redressal, care and compensation structures should be in place, in case of any unintended or unexpected harm. The AI system needs to be monitored through its lifecycle so it performs in an acceptable manner, reliably, according to the desired goals.*
- II. ***Principle of Equality:*** *AI systems must treat individuals under same circumstances relevant to the decision equally.*

¹³⁷⁵ See GDPR Art. 46, 42.

¹³⁷⁸ Background information on the Centre for the Fourth Industrial Revolution is available at the World Economic Forum’s website <https://www.weforum.org/centre-for-the-fourth-industrial-revolution>. Retrieved July 25, 2022.

¹³⁷⁹ Further information on the project is available at the World Economic Forum’s website: <https://www.weforum.org/projects/ai-ethics-framework>. Retrieved July 25, 2022.

- III. **Principle of Inclusivity and Non-discrimination:** *AI systems should not deny opportunity to a qualified person on the basis of their identity. It should not deepen the harmful historic and social divisions based on religion, race, caste, sex, descent, place of birth or residence in matters of education, employment, access to public spaces, etc. It should also strive to ensure that unfair exclusion of services or benefits does not happen. In case of an adverse decision, appropriate grievance redressal mechanism should be designed in a manner affordable and accessible to everyone irrespective of their background.*
- IV. **Principle of Privacy and Security:** *AI should maintain privacy and security of data of individuals or entities that is used for training the system. Access should be provided only to those authorized with sufficient safeguards.*
- V. **Principle of Transparency:** *The design and functioning of the AI system should be recorded and made available for external scrutiny and audit to the extent possible to ensure the deployment is fair, honest, impartial and guarantees accountability.*
- VI. **Principle of Accountability:** *All stakeholders involved in the design, development and deployment of the AI system must be responsible for their actions. Stakeholders should conduct risk and impact assessments to evaluate direct and indirect potential impact of AI systems on end-users, set up an auditing process (internal and if required external) to oversee adherence to principles and create mechanisms for grievance redressal in case of any adverse impact.*
- VII. **Principle of protection and reinforcement of positive human values:** *AI should promote positive human values and not disturb in any way social harmony in community relationships.”*

6.5. Regulator and best practice guidelines

6.5.1. International Conference of Data Protection and Privacy Commissioners

During their 40th meeting in 2018, the International Conference of Data Protection and Privacy Commissioners (ICDPPC) issued a Declaration on Ethics and Data Protection in Artificial Intelligence¹³⁸⁰ in which they underline the relevance of the empowerment of individuals and the need for the establishment of common governance principles on Artificial Intelligence. They stress that AI shall be designed in a responsible manner as part of an overall ethics by design approach, and set forth the following principles that must be obeyed when developing and applying AI:

- I. *Artificial Intelligence and Machine Learning technologies should be designed, developed and used in respect of fundamental human rights and in accordance with the **fairness principle***¹³⁸¹

¹³⁸⁰ ICDPPC declaration on Ethics and Data Protection in Artificial Intelligence published October 23 2018, available at https://www.privacyconference2018.org/system/files/2018-10/20180922_ICDPPC-40th_AI-Declaration_ADOPTED.pdf. Retrieved October 15, 2021.

¹³⁸¹ Bold means emphasis added.

- II. **Continued attention and vigilance**, as well as accountability, for the potential effects and consequences of, Artificial Intelligence systems should be ensured (...);
- III. **Artificial Intelligence systems transparency and intelligibility** should be improved, with the objective of effective implementation (...);
- IV. As part of an overall “ethics by design” approach, Artificial Intelligence systems should be **designed and developed responsibly**, by applying the principles of **Privacy by Default and Privacy by Design** (...);
- V. **Empowerment of every individual** should be promoted, and the exercise of individuals’ rights should be encouraged, as well as the creation of opportunities for public engagement (...);
- VI. **Unlawful biases or discriminations** that may result from the use of data in Artificial Intelligence should be reduced and mitigated.”

6.5.2. Guidance at authority level

Apart from the above-mentioned (legally binding) instruments which deal with data protection and data subject rights (as part of their human rights), there are also other instruments at international level which shall be considered: back in 2009, data protection authorities from more than fifty countries¹³⁸² approved the so-called Madrid Resolution on international privacy standards.¹³⁸³ This joint proposal integrates legislation from five continents and includes various principles and obligations any privacy protection legal system must strive to achieve compliance with laws applicable on data protection matters by implementing certain standards including the need to establish authorities to guarantee and supervise the rights of citizens.¹³⁸⁴ The purpose of the Madrid Resolution was to “define a set of principles and rights guaranteeing the effective and internationally uniform protection of privacy with regard to the processing of personal data (...) and the facilitation of the international flows of personal data needed in a globalized world”.¹³⁸⁵ In addition, numerous opinions on various data protection topics the so-called Article 29 Working Party¹³⁸⁶ issued¹³⁸⁷ for many years proved to be particularly useful from a privacy practitioner’s point of view. The European Data Protection Board explicitly dealt with the “dark pattern”

phenomenon and issued guidelines on dark patterns in social media platforms,¹³⁸⁸ and various supervisory authorities discussed the effects of Artificial Intelligence and issued corresponding guidance, for example, the Hambacher Erklärung¹³⁸⁹ was published in Germany; the French regulator CNIL issued a report¹³⁹⁰ on ethical issues in the context of using algorithms and Artificial Intelligence; the Norwegian data protection authority also dealt with AI,¹³⁹¹ and Latin American and Spanish DPAs issued a joint statement on data processing and Artificial Intelligence.¹³⁹² In Singapore, the Personal Data Protection Commission published an updated (second edition) version of their “Model AI Governance Framework” in 2020 in order to provide “readily-implementable guidance to private sector organizations to address key ethical and governance issues when deploying AI solutions.”¹³⁹³ The Data Protection Commission moreover launched “A.I. Verify”, “the world’s first AI governance testing framework and toolkit for companies that wish to demonstrate responsible AI in an objective and verifiable manner,” and also provides an implementation and self-assessment guide for organizations.¹³⁹⁴ The model framework and the implementation and self-assessment guide is complemented by a compendium of use cases¹³⁹⁵ to demonstrate how various organizations across different sectors and sizes implemented and / or aligned their AI governance practices with the Model Framework.¹³⁹⁶ Following requests from UK industry to clarify AI requirements, the ICO published their (updated) guidance¹³⁹⁷ on AI and Data Protection in March 2023, which included new chapters on impact assessments, and regarding ensuring fairness and lawfulness of AI.

6.5.3. FTC best practice guidance

The Federal Trade Commission (FTC) that can be considered the de-facto data protection authority for the United States¹³⁹⁸ issued new guidance on Artificial Intelligence and algorithms to explain how businesses can promote truth, fairness and equity in their use of AI.¹³⁹⁹ FTC's new guidance is focusing on best practices and lessons learned, and is based on their previous work in the area of AI which included a report on Big Data analytics and Machine Learning,¹⁴⁰⁰ and a hearing on algorithms, AI and predictive analytics.¹⁴⁰¹ In its series of best practices, FTC provides the following advice for business when using AI:

- I. *“Start with the right foundation;*
- II. *Watch out for discriminatory outcomes;*
- III. *Embrace transparency and independence;*
- IV. *Don't exaggerate what your algorithm can do or whether it can deliver fair or unbiased results;*
- V. *Tell the truth about how you use data;*
- VI. *Do more good than harm;*
- VII. *Hold yourself accountable – or be ready for the FTC to do it for you.”*

6.6. National initiatives

Various countries all over the world started working on national strategies to develop own frameworks and strengthen their competitive position with regards to Artificial Intelligence, for example China,¹⁴⁰²

India¹⁴⁰³, the U.S.A.¹⁴⁰⁴ and France:¹⁴⁰⁵ even though a regulator initiative is not the same as a legislator initiative, it shall be mentioned that in France, the national data protection supervisory authority CNIL announced to introduce a special department dedicated to AI only.¹⁴⁰⁶ Some countries issued ethical codes, for example the United Kingdom¹⁴⁰⁷ and Australia,¹⁴⁰⁸ while others already took first steps to introduce AI in the area of justice, for example Latvia.¹⁴⁰⁹ The below initiatives in Asia, the Americas, Europe and Australia shall serve as explanatory examples are not exhaustive since the legal and business landscape is very dynamic:

6.6.1. Asia

Japan's AI R&D Guidelines¹⁴¹⁰ have not been specifically designed for the Japanese market, but as a non-regulatory and non-binding international framework. Another factor to consider is that these guidelines are not only concerned with overall consequences of AI applications; they shall also serve as "draft guidelines for developers of AI systems to serve as basis for international discussion" (e.g., G7, OECD):¹⁴¹¹ these guidelines shall ensure a balance between benefits & risks of AI and help achieve a human-centered society. The committee also stressed that those guidelines shall be constantly reviewed to allow for flexibly as necessary. In addition to these R&D Guidelines Japan issued for international discussion, the country was also working on Machine Learning Quality Management Guidelines to

world for almost four decades”.¹⁴²³ China also announced the formation of the National Artificial Intelligence Standardization Group and Expert Advisory Group to oversee the nation’s AI development.¹⁴²⁴ Singapore introduced principles to promote “Fairness, Ethics, Accountability and Transparency in the Use of Artificial Intelligence and Data Analytics in Singapore’s Financial Sector.”¹⁴²⁵ Singapore’s initiative is a good example that it is difficult to classify all those different initiatives appropriately: on the one hand, this is a national initiative, on the other hand, it might have the potential to lead the path forward for that specific industry. India’s National Institution for Transforming India (NITI) published the nation’s national strategy on Artificial Intelligence back in 2018,¹⁴²⁶ and the strategy focuses, amongst other things, on sectors like health and education as well as (smart city) infrastructure and mobility to increase social inclusion and addresses issues like ethics, bias, and privacy. India’s strategy paper proposes the creation of Centers of Research Excellence in AI, and in 2019, India’s government formed a committee to push for an organized AI policy to further India’s AI mission, and the Ministry of Electronics and Information Technology released its own proposal to set up a national AI program.¹⁴²⁷ Indian government’s policy think tank NITI Aayog and the Centre for the Fourth Industrial Revolution partnered to co-design an ethics framework to ensure the responsible use of AI.¹⁴²⁸ These two organizations co-designed principles of AI ethics¹⁴²⁹ and jointly drafted self-

assessment guides for the public and private sectors.¹⁴³⁰ In recent years, further countries developed national AI initiatives and plans, for example Malaysia,¹⁴³¹ Indonesia¹⁴³² or Taiwan.¹⁴³³

6.6.2. Australia and New Zealand

In order to build Australia's Artificial Intelligence capability and help raise trust in AI technologies, the country developed an AI ethics framework to guide businesses and governments when they design, develop and implement AI.¹⁴³⁴ the outcome of their program is a set of voluntary AI ethics principles including background information on how it was developed as well as guidance on when and how to apply those principles. Moreover, the country's leading standards organization released a discussion paper on developing standards for Artificial Intelligence which underlines the importance of the development of AI standards for the future use of this cutting-edge technology.¹⁴³⁵ Australia's neighbor New Zealand launched a AI forum¹⁴³⁶ in 2017 to connect the country's AI community including citizens, business, academia, and the government and to advance New Zealand's AI ecosystem through advocacy and collaboration.¹⁴³⁷ Since the forum is a not-for-profit, non-governmental body, the forum's work cannot be considered a national strategy, however, their report¹⁴³⁸ may serve as a basis to shape New Zealand AI landscape. In addition, New Zealand also launched an initiative for the government's data system, the Algorithm Charter for Aotearoa New Zealand.¹⁴³⁹

¹⁴³⁰ Their self-assessment guidance document for the public and private sectors has been published August 2021, and is available at <https://www.niti.gov.in/sites/default/files/2021-08/Part2-Responsible-AI-12082021.pdf>. Retrieved July 25, 2022.

Retrieved October 17, 2021.

6.6.3. Europe

It can generally be said that Europe has a growing AI industry presence, for example, Spain,¹⁴⁴⁰ Sweden,¹⁴⁴¹ the Netherlands¹⁴⁴² and Italy¹⁴⁴³ are actively engaging in AI. Many other countries dealt with the issue of Artificial Intelligence and published action plans and strategies of their own, for example Luxembourg,¹⁴⁴⁴ Lithuania,¹⁴⁴⁵ Malta¹⁴⁴⁶ or Norway.¹⁴⁴⁷ Finland reviewed the public sector use of automation and evaluated the introduction of mandatory due diligence legislation,¹⁴⁴⁸ and AI initiatives are starting to emerge at regional level: the autonomous regions of Valencia¹⁴⁴⁹ and Catalonia¹⁴⁵⁰ introduced their own AI strategies. France announced their “mission for a meaningful AI”¹⁴⁵¹ which stresses that Artificial Intelligence shall be based on human rights and that AI should, among other things, address ethics, employment, and diversity.¹⁴⁵² For the purposes of this paper, two countries shall be examined in greater detail as regards their national AI strategy: Germany and the UK. The UK has a well-established tech landscape and is traditionally strong in research,¹⁴⁵³ and its AI policy

discussions intensified in recent years: ¹⁴⁵⁴ on top of the famous Alan Turing Institute – that is: the National Institute of AI,¹⁴⁵⁵ the UK introduced a Committee on Artificial Intelligence,¹⁴⁵⁶ established a Centre for Data Ethics and Innovation (CDEI)¹⁴⁵⁷ which will be tasked with AI monitoring and testing,¹⁴⁵⁸ and intends to appoint a Minister for AI.¹⁴⁵⁹ The UK government moreover announced that it intends to revisit its AI strategy¹⁴⁶⁰ which might have implications for the overall level of data protection given the discussions around softening the conditions around (re-)use of personal data for research and considerations if the ICO is the right forum (regulator) for determining fairness in profiling and automated decision-making.¹⁴⁶¹ The UK introduced data protection law reforms¹⁴⁶² that will, amongst other things, have consequences for documentation requirements since records of processing activities or impact assessments may no longer be needed.¹⁴⁶³ Moreover, legitimate interest assessments will be axed, and some defined processing activities will be exempt from any formal review.¹⁴⁶⁴ In its new AI rulebook,¹⁴⁶⁵ the UK takes a different regulatory approach to the EU whereby AI regulation will

be less centralized and will instead allow existing regulatory bodies to make decisions based on their specific context and underline UK's ambitions to become an AI superpower.¹⁴⁶⁶ Developments in the context of "BREXIT"¹⁴⁶⁷ caused further unrest, however, in early 2021, the European Commission launched a "process towards the adoption of two adequacy decisions for transfers of personal data to the United Kingdom, one under the General Data Protection Regulation and the other for the Law Enforcement Directive"¹⁴⁶⁸, a step that many welcomed and some predicted.¹⁴⁶⁹ In June 2021, the European Commission adopted these two adequacy decisions, meaning that organizations in the EU can transfer personal data to organizations in the UK without restriction, and with no need to use SCCs to ensure an adequate level of protection.¹⁴⁷⁰ Germany has an AI strategy of its own,¹⁴⁷¹ and the German Data Ethics Commission explained the need for a human-centric approach and confirmed core principles like transparency and explicability and robustness as well as values like non-discrimination in their 2019 recommendation.¹⁴⁷² The expert opinion of the German Data Ethics Commission distinguishes between algorithm-based (suggestion-only), algorithm-driven (limited leeway) and fully automated decisions. It moreover pursues further ideas by presenting a total of not less than 75 recommendations for the use of Artificial Intelligence, including the call for a regulation for Algorithmic Systems and by suggesting various new approaches to AI: a labeling requirement (e.g., for bots¹⁴⁷³); licensing procedures; product liability; a risk-based regulatory approach based on a graded model for AI reflecting the degree of criticality involved in the data processing activity; a specific right to access for researchers and journalists in sectors that are of particular interest to society; a specific duty with regard to interconnectivity in certain sectors (e.g., messaging services, social media). The idea of a right to data

ownership which has been discussed in the literature¹⁴⁷⁴ as one possible way to strengthen individuals' rights but is not recommended by the commission since the introduction of new exclusive rights is believed to complicate the legal framework rather than solving existing problems. On top of the 2019 Data Ethics Commission recommendations, Germany's "Study Commission on Artificial Intelligence" issued its final report which also included specific recommendations.¹⁴⁷⁵ In 2020, the German Federal Government adopted its AI strategy¹⁴⁷⁶ and committed to increase the expenditure for the promotion of AI by EUR 5 billion by 2025.¹⁴⁷⁷ At present, German industry and trade associations are lobbying the EU institutions with the aim to amend the AI Act because "overregulation of AI would discourage the development of innovative applications."¹⁴⁷⁸

6.6.4. Hungary

In Hungary, an AI Coalition has been formed in 2018¹⁴⁷⁹ as a partnership between governmental institutions, academics, and practitioners from leading IT businesses. In 2019, the AI Coalition released an AI Action Plan, and drew up Hungary's AI strategy for the Hungarian Government in 2020. The Hungarian national AI strategy¹⁴⁸⁰ calls for the development of sector-specific regulatory frameworks to ensure that the regulatory needs for AI development are adapted to the relevant industry areas, it focuses on strengthening of the foundation pillars of its AI ecosystem (for example, with respect to infrastructure deployment, research and development, education and competence development, as well as a regulatory and ethical framework); it is furthermore planned to initiate transformative programs for the benefit of citizens (for example, through automated administration procedures, or data-wallets and personalized services), and aims to ensure a responsible, reliable and human-centered utilization of AI technologies by means of the following policies:

- *Creating an ethical framework: developing an AI code of conduct by the first half of 2021 in collaboration between the Ministry of Justice, the Ministry for Innovation and Technology, AI Innovation Hub and the Central Statistical Office;*
- *Establishing a regulatory framework for AI: the objective is to amend the current regulatory system to suit AI and to align it to EU regulations;*
- *Building data management regulation: the objective is to set up regulations for the use and exchange of public and private data and to define rules regarding data monetization.”*
- *Setting up an Artificial Intelligence Regulation and Ethics Knowledge Centre: the aim is to create and coordinate an extensive pool of experts to help resolve legal issues and matters of ethics relating to the regulation of AI and the implementation of the strategy;¹⁴⁸¹*

Closely connected to the last point is another important aspect of Hungary’s AI strategy: the goal to leverage human competencies and to raise individuals’ awareness and knowledge with respect to AI by, amongst other things, providing trainings¹⁴⁸² and by transforming the educational system to prepare for the digital world, including the future labor market as outlined in the corresponding digital education strategy.¹⁴⁸³ It is important to note that the envisaged reform of the education system not only addresses students to help them develop AI-related skills and competencies, but also foresees specific training for teachers, and the establishment of PhD programs in the field of AI. Overall, the human capital aspect of Hungary’s AI strategy is focused on lifelong learning and upskilling of the workforce.

6.6.5. Israel and the Middle East

Despite the fact that Israel is a small country, the nation is determined to be the next major Artificial Intelligence player.¹⁴⁸⁴ Israel is heavily engaged in AI and launched a national AI program, however, lack of budget threatens its implementation.¹⁴⁸⁵ In the framework of “Smart Dubai”, which is an initiative that fosters digitalization and technologies like Blockchain and Artificial Intelligence, Dubai

issued AI ethics principles and guidelines to “deliver detailed guidance for the crucial issues of fairness, accountability, transparency and explainability of the algorithms at the heart of AI systems. We would like to see the Dubai AI Ethics Guidelines evolve into a universal, practical and applicable framework informing ethical requirements for AI design and use.”¹⁴⁸⁶ Dubai’s AI principles focus on ethics, humanity, inclusiveness and security¹⁴⁸⁷ and Dubai moreover offers a free self-assessment AI ethics tool to provide practical help for the public and private sector as well as anyone “interested in how ethical AI is applied in society and city service settings”.¹⁴⁸⁸ Given the importance of AI for various industries and in particular for autonomous weapons and drones, Israel and UAE defense companies partner on Artificial Intelligence.¹⁴⁸⁹ In recent years, further countries in the Arabian Peninsula engaged in their own national AI strategies, for example Qatar.¹⁴⁹⁰

6.6.6. Latin America

Mexico joined many other ambitious nations in their wish to establish themselves as a leader in digital technologies such as Artificial Intelligence and was the first country in Latin America to announce a national AI strategy.¹⁴⁹¹ Mexico’s approach is unique insofar as it focuses on the social impacts of AI, for example by addressing use cases like combating corruption, reducing crime, improving public health and increasing financial inclusion.¹⁴⁹² Brazil’s Ministry of Science, Technology, Innovations and Communications published the nation’s strategy for digital transformation to harmonize and coordinate various governmental initiatives on digital issues.¹⁴⁹³ In addition, the government launched a national

plan for the Internet of Things¹⁴⁹⁴ that will be supported by several AI laboratories¹⁴⁹⁵ to cover different areas and aspects of AI. Like Mexico, Brazil is also concerned with social impact of Big Data and Artificial Intelligence, which is why their strategy includes a provision “to evaluate such consequences and propose policies which maximize positive results and mitigate potential negative effects.”¹⁴⁹⁶ In the meantime, further South American countries like Colombia,¹⁴⁹⁷ Chile¹⁴⁹⁸ and Uruguay¹⁴⁹⁹ have been working on their own national AI strategies.

6.6.7. North America

Together with France, Canada issued a statement on Artificial Intelligence¹⁵⁰⁰ with the wish to promote human-centric AI that is based on human rights and values like inclusion and diversity – as well as innovation and economic growth.¹⁵⁰¹ Canada issued a Directive on Automated Decision-Making,¹⁵⁰² and Canada’s National Research Council published an advisory statement on human ethics in Artificial Intelligence and Big Data research.¹⁵⁰³ The Canadian government announced the “Declaration of the International Panel on AI”¹⁵⁰⁴ which states that participants in the IPAI will obey the following values for the development and use of AI:¹⁵⁰⁵

Canada furthermore introduced the Digital Charter Implementation Act,¹⁵⁰⁶ a package of laws that, if passed, will reform the Canadian privacy law including a tribunal specific to privacy and data protection – and implement Canada’s first AI legislation, the Artificial Intelligence and Data Act (AIDA) which aims at protecting individuals from potential harms and biased outputs AI systems can generate. AIDA establishes requirements for the design, development, use, and provision of AI systems, mandates impact assessments, and foresees administrative monetary penalties, or even criminal offences for certain conduct in relation to AI systems.¹⁵⁰⁷

6.6.8. United States

More and more U.S. states are about to introduce privacy bills of their own; developments in the U.S.A. with regards to (consumer) privacy laws are so dynamic that corresponding legal news alerts are delivered on a weekly basis.¹⁵⁰⁸ To name a few, the following bills establish consumer rights and business obligations related to privacy, including key provisions about transparency, consent, data subject rights, and the designation of Privacy Officers:¹⁵⁰⁹ the Information Transparency & Personal Data Control Act,¹⁵¹⁰ the Deceptive Experiences to Online Users Reduction Act,¹⁵¹¹ the Banning

Technology (NIST) to release a plan¹⁵²⁷ for federal engagement on AI standards that address both, technical and safety issues, as well as some substantive concerns around AI like data quality and explicability of AI decisions as well as ethical considerations.¹⁵²⁸ In 2021, NIST issued a report on trust and Artificial Intelligence in which they conclude that trust will be necessary for any human-AI collaboration: “if the AI system has a high level of technical trustworthiness, and the values of the trustworthiness characteristics are perceived to be good enough for the context of use, and especially the risk inherent in that context, then the likelihood of AI user trust increases.”¹⁵²⁹ The White House’s Office of Science and Technology Policy released a draft Guidance for Regulation of Artificial Intelligence Applications¹⁵³⁰ which includes ten principles for agencies to consider when deciding whether and how to regulate AI:¹⁵³¹

- I. **“Public trust in AI** – the government’s regulatory and non-regulatory approaches to AI promote reliable, robust and trustworthy AI applications, which will contribute to public trust in AI;
- II. **Public participation** – agencies should provide ample opportunities for the public to provide information and participate in all stages of the rulemaking process;
- III. **Scientific integrity and information quality** – approaches to AI applications should leverage scientific and technical information and processes;
- IV. **Risk assessment and management** – approaches to AI should be based on a consistent application of risk assessment and risk management across various agencies and various technologies;
- V. **Benefits and costs** – [agencies should] ... select those approaches that maximize net benefits (including potential economic, environmental, public health and safety, and other advantages; distributive impacts; and equity);
- VI. **Flexibility** – agencies should pursue performance-based and flexible approaches that can adapt to rapid changes and updates to AI applications;

- VII. ***Fairness and nondiscrimination*** – “agencies should consider ... whether the AI application at issue may reduce levels of unlawful, unfair, or otherwise unintended discrimination as compared to existing processes;
- VIII. ***Disclosure and transparency*** – transparency and disclosure can increase public trust and confidence in AI applications;
- IX. ***Safety and security*** – agencies should ... encourage the consideration of safety and security issues throughout the AI design, development, deployment, and operation process;
- X. ***Interagency coordination*** – a coherent and whole-of-government approach to AI oversight requires interagency coordination.”

The National Institute of Standards and Technology furthermore released a draft of an AI Risk Management Framework (AI RMF), a set of high-level voluntary guidelines and recommendations that organizations can follow to manage risks in the design, development, use, and evaluation of AI systems.¹⁵³² This framework is still under development, and NIST has posted the latest iterations.¹⁵³³ NIST furthermore released an initial draft of a playbook¹⁵³⁴ as a companion to the AI Risk Management Framework. NIST separately released a document titled, “Towards a Standard for Identifying and Managing Bias within Artificial Intelligence”¹⁵³⁵ which aims to provide guidance for mitigating harmful bias in AI systems.

6.6.8.2. Blueprint for an AI bill of rights

In 2022, the White House published a document to open a discussion about a Bill of Rights in an AI-powered world:¹⁵³⁶ the Blueprint for an AI Bill of Rights is a “set of five principles and associated practices to help guide the design, use, and deployment of automated systems to protect the rights of the American public in the age of artificial intelligence.”¹⁵³⁷ The following ideas are being discussed in the

Retrieved December 31, 2022.

¹⁵³⁷ Details on the Blueprint for an AI bill of rights are available at the White House’s website <https://www.whitehouse.gov/ostp/ai-bill-of-rights/what-is-the-blueprint-for-an-ai-bill-of-rights/#:~:text=The%20Blueprint%20for%20an%20AI%20Bill%20of%20Rights,American%20public%20in%20the%20age%20of%20artificial%20intelligence>. Retrieved December 31, 2022.

framework of the AI bill of rights:¹⁵³⁸ a right to know when AI is impacting civil liberties and a right to meaningful recourse should an algorithm’s recommendations harm individuals as well as freedom from being subjected to AI decisions made from biased data sets, and freedom from surveillance (i.e., voice-activated systems, computer-usage monitoring systems, facial recognition, etc.). The “vision for protecting civil rights in the Algorithmic Age” lays out “five common sense protections to which everyone in America should be entitled”:¹⁵³⁹

- I. **“Safe and Effective Systems:** *You should be protected from unsafe or ineffective systems.*
- II. **Algorithmic Discrimination Protections:** *You should not face discrimination by algorithms and systems should be used and designed in an equitable way.*
- III. **Data Privacy:** *You should be protected from abusive data practices via built-in protections, and you should have agency over how data about you is used.*
- IV. **Notice and Explanation:** *You should know when an automated system is being used and understand how and why it contributes to outcomes that impact you.*
- V. **Human Alternatives, Consideration, and Fallback:** *You should be able to opt out, where appropriate, and have access to a person who can quickly consider and remedy problems you encounter.”*

Even though the Blueprint for an AI bill of rights aims to protect Americans, it shall perhaps not be interpreted as a mere national initiative: tech giants such as Microsoft, Meta, or Google and many other players in the field of AI are headquartered in the U.S., and if all these companies comply with the proposed AI rules, the effects – the scope – of this bill of rights will likely go beyond national borders. Moreover, it shall be noted that the EU and the US are working on a “Joint Roadmap for Trustworthy AI and Risk Management”¹⁵⁴⁰ to, amongst other things, help build a “common repository of metrics for measuring AI trustworthiness and risk management methods.”¹⁵⁴¹

6.7. Other

6.7.1. Rome Call for AI Ethics

Individual and societal implications of certain AI applications are so significant that even the Vatican raised the issue in their 2020 conference “The Good Algorithm”, the Vatican Academy for Life concluded the session with the Rome Call for AI Ethics.¹⁵⁴² Microsoft and IBM are the first signatories to this AI ethics code that calls for a human-centered approach.¹⁵⁴³ The initiative focuses on the responsibility that comes with new digital technologies. The Rome Call for AI Ethics comprises three impact areas ethics, education and rights and names the following six principles:¹⁵⁴⁴

- I. **“Transparency”¹⁵⁴⁵**: *In principle, Artificial Intelligence systems must be explainable.*
- II. **Inclusion**: *the needs of all human beings must be taken into consideration so that all can benefit from and enjoy the best possible conditions to express themselves and grow.*
- III. **Responsibility**: *Designers and developers of Artificial Intelligence solutions must act responsibly and transparently.*
- IV. **Impartiality**: *Systems should not be created or operated according to bias, in view to protect human equality and dignity.*
- V. **Reliability**: *Artificial Intelligence systems must be able to operate reliably.*
- VI. **Security and privacy**: *Artificial Intelligence systems must work securely and respect the privacy of users.”*

6.7.2. Hippocratic Oath for Data Scientists

Another noteworthy initiative is the Hippocratic Oath for Data Scientists: the interesting idea behind this voluntary commitment is that, unlike medical staff that is trained on and aware of ethics aspects of their work from the beginning, this is not common in data science – despite the fact that even players like Microsoft say it could make sense to “bind coders to a pledge like that taken by physicians to first do no harm.”¹⁵⁴⁶ Since many activities in the area of data science can have serious consequences for

individuals and society,¹⁵⁴⁷ data scientists who process data and design algorithms should respect the following three principles:¹⁵⁴⁸

- I. **“Responsibility and Neutrality:**¹⁵⁴⁹ *Every data scientist has to assume his responsibilities in the event of breaches or conflicts of interest, and he must alert if any illegal acts related to data are observed. He must also exercise his professional activity respecting the privacy and dignity of people in all their dimensions;*
- II. **Transparency:** *As a data scientist, I have the right to inform all stakeholders in an understandable and precise manner about the purposes, modalities, and potential implications of my use of data;*
- III. **Equity:** *I will always ensure that individuals or groups are not discriminated on the basis of illegal or illegitimate criteria, directly or indirectly, related to my data work.”*

This chapter has shown that the rapid spread of Artificial Intelligence systems led to a rise in various (best practice, ethics and human rights-based) guidelines and recommendations to help with the use and further development of such applications. In summary, the current legal framework for AI can be grouped as follows: there is legislation for specific processing operations (e.g.) automated decision making, for specific industries (e.g. finance or health), and for specific technology (e.g. facial recognition) as well as rules for accountability for (unintended) consequences by the use of AI (e.g. criminal, civil), and there are moreover numerous voluntary ethics codes.¹⁵⁵⁰ However, as for the latter, there has been little focus on analyzing these efforts to understand the main principles behind these frameworks. To that end, the Berkman Klein Center for Internet and Society evaluated numerous AI principles documents to detect potential common standards; their research uncovered a growing consensus around eight key thematic trends:¹⁵⁵¹

¹⁵⁴⁷ Lori Sherer: Data scientists, take a Hippocratic Oath: While the ethics of analytical tools can be tricky to parse, five basic principles can help data scientists address the challenge. Article published June 13 2018, available at <https://www.bain.com/insights/data-scientists-take-a-hippocratic-oath-forbes/> Retrieved October 17, 2021.

- I. **“Privacy¹⁵⁵²** including control over use of data, consent, privacy by design, recommendations for data protection laws, the ability to restrict processing, as well as the right to erasure and rectification;
- II. **Accountability** including recommendation for new regulations, impact assessments, evaluation and auditing requirement, verifiability, and replicability as well as liability and legal responsibility and the ability to appeal, environmental responsibility and the creation of a monitoring body and remedies for automated decisions;
- III. **Safety and security** including reliability, predictability, and security by design;
- IV. **Transparency and explainability** including open source, data and algorithms, notifications when interacting with AI and whenever AI makes a decision about an individual, regular reporting requirements and the right to information and finally, open procurement (for governments);
- V. **Fairness and non-discrimination** including the prevention of bias, equality, inclusiveness in design and impact as well as representative and high-quality data;
- VI. **Human control of technology including human review of automated decisions** and the ability to opt out of automated decisions;
- VII. **Professional responsibility** including multistakeholder collaboration, responsible design, consideration of long-term effects as well as accuracy and scientific integrity;
- VIII. **Promotion of human values** including leveraged to benefit society, human flourishing, and access to technology.”

The researchers stress that, by sharing their observations, they hope that policymakers and others “working to maximize the benefits and minimize the harms of AI will be better positioned to build on existing efforts and to push the fractured, global conversation on the future of AI toward consensus.”¹⁵⁵³ Obviously, such research is very welcome and of great value, but the problem with all these initiatives is that, regardless of whether the guideline or recommendation is issued at international or national level or published by civil society, multi-stakeholder or intergovernmental organizations or if it originated in the private sector – but the problem is that, at present, most of the these initiatives are legally not binding.¹⁵⁵⁴ Governments around the world are working towards trustworthy AI, but there is no consensus on how to best regulate AI: there is agreement that transparency is a minimum requirement, and discussions started shifting in the direction of human rights protections with growing calls to ban facial recognition, but there is “significant divergence regarding what stakeholders want to see in the

upcoming EU legislation and their respective national policies”, and some legislators even expressed the fear of over-regulation.¹⁵⁵⁵

In summary, a common feature of most international, intergovernmental, multistakeholder, civil society initiatives and expert guidelines is that they focus on established principles. An analysis of propositions relating to AI applications shows that most proposals suggest that any future AI regulations shall take the following into consideration: accountability and responsibility, human control of technology, safety and security, transparency and explicability, fairness, non-discrimination as well as privacy and the promotion of human values, which contains the following (main principles within each theme):¹⁵⁵⁶

- I. **Transparency and explainability:** *Right to information, use of open-source data and algorithms, notification requirements when interacting with an AI and when AI makes decisions about individuals, regular reporting, open procurement (for government institutions);*
- II. **Accountability:** *Verifiability and replicability, liability and legal responsibility, impact assessments, evaluation and auditing requirement remedy for automated decision, creation of monitoring bodies, social and environmental responsibility;*
- III. **Privacy:** *Privacy by Design, control over use of personal data, ability to restrict processing, right to rectification, right to erasure, recommendation for further development of data protection laws;*
- IV. **Human control of technology:** *Human control of technology including human review of automated decisions, ability to opt out of automated decision-making;*
- V. **Professional responsibility:** *Responsible design, scientific integrity, accuracy, multistakeholder collaboration, consideration of long-term effects;*
- VI. **Fairness and non-discrimination:** *Prevention of bias, inclusiveness in design and impact, equality, representative and high-quality data;*
- VII. **Promotion of human values:** *access to technology, leveraged to benefit society, human values and human flourishing;*
- VIII. **Safety and security:** *Safety and security by design, reliability, predictability.*

¹⁵⁵⁵ AccessNow: Europe’s approach to Artificial Intelligence: How AI strategy is evolving. Report published December 2020, available at <https://www.accessnow.org/cms/assets/uploads/2020/12/Europes-approach-to-AI-strategy-is-evolving.pdf>. Retrieved October 17, 2021.

¹⁵⁵⁶ Jessica Fjeld, Nele Achten, Hannah Hilligoss, Adam Nagy, Madhulika Srikumar: Principled Artificial Intelligence: Mapping consensus in ethical and rights-based approaches to principles for AI. However, it is important to note that the nuances within these proposals, even though they are based on existing privacy principles, go beyond the data protection rules as we know them today. Therefore, the new approaches within the recommendations could briefly be summarized as follows:

- I. **Introduction of new obligations**, for example, an identification obligation: the latter intends to make true operators known, meaning that the institution responsible for an AI system must be made known to the public; ditto for the use of AI which could be indicated by using corresponding labels or watermarks for AI generated content. Another idea is that a termination obligation shall apply when human control of the system is no longer possible, or standardized testing procedures as accuracy of datasets is decisive for proper results;
- II. **Enhancement and further development of existing rules**, for example, around information obligations: transparency could move away from individual-level information in the direction of publicity through the establishment of mandatory public registries or databases; another dimension of this approach is to implement traceability mechanisms and to ensure explainability as well as reproducible results;
- III. **Widening the scope of reviews and inclusion of further values**, for example, some initiatives deal with the issue of sustainable development of AI and environmental responsibility:¹⁵⁵⁷ others stress the need for taking societal consequences into consideration; ditto for the respect of democratic values given various campaigns haven proven AI's potential for misinformation;
- IV. **Establishment of a new AI regulatory function** that not only audits algorithms, but that acts as a repository of knowledge and this way, allows for setting (industry-specific) best practice recommendations for the public and private sector;
- V. **Introduction of new types of certifications**, for example, by introducing mandatory certificates of fairness to show the AI system has undergone a corresponding review. This idea goes hand in hand with
- VI. **The introduction of liability incentives**, for example, such certificates may be favorable in comparison to fines, which, in addition, only work retrospectively, i.e., when errors or damages already occurred;
- VII. **Introduction of new individual rights**, for example, the right to participation or the right to human intervention or the right to have data replaced instead of processing restricted.
- VIII. **Further strengthening individual rights**, for example, by establishing adequate redress mechanisms, allowing for overall contestability of AI systems, or the idea of data ownership.

¹⁵⁵⁷ Kate Saenko: It takes a lot of energy for machines to learn – here's why AI is so power-hungry. Article published December 14 2020, available at <https://theconversation.com/it-takes-a-lot-of-energy-for-machines-to-learn-heres-why-ai-is-so-power-hungry-151825>. Retrieved February 28, 2023.

IX. Introduction of strict prohibitions, for example, for unitary scoring, secret profiling, or facial recognition to be clear on inadmissible red lines.

This chapter provided a detailed overview over existing recommendations, guidance, and initiatives in the context of AI at institutional, international, European, and national level. While it cannot be considered exhaustive, it showed that already by now, even though some legal initiatives have not been enacted yet, there is a variety of civil society and multistakeholder and regulator recommendations that all have in common is that they address potential issues when Big Data and AI applications are designed and implemented from a legal, accountability and liability, as well as societal, individual, and privacy perspective. While most of these initiatives are non-binding, they are promising and inspiring since they discuss new concepts, new controller obligations, and new data subject rights.

7. Future developments to consider

This chapter focuses on proposed regulations at EU level which may be relevant when AI is designed and applied, for example, the proposals for an AI Act and an AI Liability Directive, for a revised Product Liability Directive, for a renewed NIS Directive, a Cyber Resilience Act, a machinery regulation, for the European Health Data Space, or for the re-use of public sector information to only name a few. Given that international data transfers are factually often indispensable for any kind of data processing operations, the chapter furthermore deals with prerequisites and conditions for (alternative) data transfer mechanisms, potential technical solutions as well as data localization requirements. The chapter concludes with considerations about the emerging U.S. legal landscape, which is important because relevant vendors and suppliers are mostly U.S.-based.

7.1. Proposed regulations at EU level

7.1.1. Proposal for a Machinery Regulation

The proposal for a regulation of the European Parliament and of the Council on machinery products (Machinery Regulation) has been published in April 2021¹⁵⁵⁸ and shall replace the current Machinery Directive¹⁵⁵⁹ which, amongst other things, is about the protection of workers and citizens.¹⁵⁶⁰ The

¹⁵⁵⁸ The text of the Machinery Regulation is available at <https://beta.op.europa.eu/en/publication-detail/-/publication/1f0f10ee-a364-11eb-9585-01aa75ed71a1>. Retrieved October 17, 2021.

¹⁵⁵⁹ Directive 2006/42/EC of the European Parliament and of the Council of 17 May 2006 on machinery, and amending Directive 95/16/EC (Machinery Directive) is available at <https://eur-lex.europa.eu/legal-content/EN/TXT/?uri=CELEX%3A32006L0042#:~:text=%20Text%20%201%20Where%20a%20Member%20State,concerned%20without%20delay.%0AThe%20Commission%20shall%20consider%2C...%20More%20>. Retrieved October 17, 2021.

¹⁵⁶⁰ The European Commission provides background on EU's machinery legislation at their website: https://ec.europa.eu/growth/sectors/mechanical-engineering/machinery_en. Retrieved October 17, 2021.

Machinery Directive was thus concerned with safety and health, and the Machinery Regulation is intended to complement the draft regulation on Artificial Intelligence:¹⁵⁶¹ while the AI-relevant draft addresses risks of AI systems, the draft of a new Machinery Regulation seeks to ensure the safe integration of AI systems into machinery products such as robots or industrial production lines to safeguard users and consumers. The Machinery Regulation also seeks to provide more legal clarity and at the same time, reduce manufacturers' administrative and financial burden as companies would only need to undertake one conformity assessment for both the AI Regulation and the Machinery Regulation.¹⁵⁶²

7.1.2. Proposal for a Data Governance Act

The draft Data Governance Act (DGA)¹⁵⁶³ focuses on the availability and sharing of data by allowing for re-use of data, by establishing providers of data sharing services as trusted (i.e. neutral) intermediaries, and by creating a European Data Innovation Board to ensure consistent practice and facilitate cooperation between the competent authorities.¹⁵⁶⁴ The DGA has been designed to be fully compliant to GDPR, however, the challenge already starts with terminology¹⁵⁶⁵: under the Data Governance Act, data means any digital representation of acts, facts or information and any compilation of the same, including sound as well as visual or audiovisual recording. In addition, the DGA uses a novel (unique) set of terms, for example “data holder” and “data user” which is different from the terminology used in the General Data Protection Regulation.¹⁵⁶⁶ The Data Governance Act moreover introduces the idea of data altruism to make data available for altruistic purposes¹⁵⁶⁷, and it is questionable whether this truly matches GDPR’s requirements with regards to purpose limitation,

transparency and consent as well as rules on compatible re-use of personal information or existing privileges for research purposes. In this context, the European Data Protection Supervisor and the European Data Protection Board adopted a joint opinion on the DGA¹⁵⁶⁸ in which they recommend aligning the Data Governance Act with present (GDPR) rules on the protection of personal data to ensure that the level of protection of individuals' personal data is not affected, and that obligations set out in applicable data protection legislation are not altered. They furthermore suggest clarifying the data altruism purposes and to define compatible purposes for which further processing of personal information may be lawful. In light of possible risks for data subjects related to the processing of their personal information by data sharing service providers or data altruism organizations, the EDPS and the EDPS consider that envisaged requirements for these entities are not sufficient; the EDPS and the EDPS therefore recommend exploring alternatives such as codes of conduct or certification mechanisms.¹⁵⁶⁹ The DGA foresees the establishment of a European Data Innovation Board,¹⁵⁷⁰ together with the two other bodies foreseen by the DSA and the DMA, which altogether creates three new oversight bodies. As much as oversight, enforcement and governance shall be welcomed, this results a multiplicity of supervisors on top of national data protection, consumer protection and competition regulatory agencies – as well as courts¹⁵⁷¹ that deal with individual claims¹⁵⁷² or competition¹⁵⁷³ or antitrust cases.¹⁵⁷⁴ As part of the trialogue discussions, a political agreement on the DGA was reached between the European Parliament and the Council of the European Union in November 2021.¹⁵⁷⁵

This agreement was formally approved by the Parliament in April 2022; it enters into force after formal adoption by the Council and 15 months after publication in the Official Journal.

7.1.3. Proposal for a Data Act

The European Commission proposed the Data Governance Act as part of the European Strategy for data,¹⁵⁷⁶ and the Data Act¹⁵⁷⁷ is a follow up on that proposal with the objective “to propose measures to create a fair data economy by ensuring access to and use of data, including in business-to-business and business-to-government situations.”¹⁵⁷⁸ Under this initiative, a review of Directive 96/9/EC on the legal protection of databases is also planned in order to ensure continued relevance for the data economy.¹⁵⁷⁹ The proposed Data Act wants to encourage sharing of data – including non-personal information¹⁵⁸⁰ – to realize the full potential of EU’s data economy by:¹⁵⁸¹ promoting fairness (i.e., ensuring fair distribution of usage rights along the value chain; identifying contractual unfairness where there is unequal bargaining power compromising competition), by enabling for greater legal certainty (i.e. safeguarding intellectual property rights; clarifying if database rights can cover machine-generated data; ensuring that the rights under the Database Directive do not impede cross-border data flows and data sharing), and by ensuring portability (i.e. introducing (mandatory?) interoperability requirements in order to allow for easy switching of providers without contractual, technical and / or economic barriers. This legal initiative would thus allow for addressing certain problems that limit data sharing at present: lack of legal clarity, lack of economic incentives, lack of trust and fear of misappropriation by third parties and imbalances in negotiating power.¹⁵⁸² In the context of data economy, the proposed Data Act was criticized because of its potential clash with the GDPR as some believe that EU citizens could end up with less protection of their data rights,¹⁵⁸³ and the proposal would furthermore need to be coordinated with other legislative measures, such as intellectual property rights or trade secrets.¹⁵⁸⁴ The Commission

¹⁵⁸⁴ Europe’s Commissioner for the Internal Market, Thierry Breton said that “The Data Act will unlock vast troves of industrial data and contribute to the emergence of a sovereign single market for data. European data, in

published an impact assessment on the Data Act,¹⁵⁸⁵ and the EDPB and the EDPS issued a joint opinion¹⁵⁸⁶ on the Data Act in which they raise concerns with regards to the governance architecture in the proposal, for example, the fact that the Data Act¹⁵⁸⁷ might lead to forum shopping because it does not provide a consistency mechanism or harmonized penalties, or the fact that the relationship between competent authorities remains unclear.¹⁵⁸⁸

7.1.4. Proposal for a Digital Services Act

As part of the European Union's digital strategy, the European Commission published¹⁵⁸⁹ the Digital Services Act package which consists of the Digital Services Act (DSA) and the Digital Markets Act (DMA) in late 2020. DSA and DMA intend to regulate the provision of services over the Internet,¹⁵⁹⁰ the Digital Services Act and the Digital Markets Act have two main goals:¹⁵⁹¹ “to create a safer digital space in which the fundamental rights of all users of digital services are protected, and to establish a level playing field to foster innovation, growth, and competitiveness, both in the European Single Market and globally.” The Digital Markets Act foresees the creation of a Digital Markets Advisory Committee¹⁵⁹², and the Digital Services Act provides for the establishment of a European Board for

particular industrial data, needs to be shared, stored and processed in line with European rules such as data protection, respect of intellectual property and trade secrets.” Source: <https://data.europa.eu/en/news/public-consultation-data-act>. Retrieved October 17, 2021.

Digital Services,¹⁵⁹³ meaning that new bodies are created at EU level. The DSA applies to intermediary services offering network infrastructure such as Internet access providers and hosting (including cloud) services as well as online platforms and will replace the e-Commerce directive which was adopted in 2000.¹⁵⁹⁴ Since the Digital Services Act will modernize the e-Commerce Directive that many consider to be the “backbone of EU’s Internet legislation”,¹⁵⁹⁵ this initiative represents a major reform of European Internet regulations.¹⁵⁹⁶ Amongst other things, i.e. from a data subject perspective, the DSA introduces requirements such as enhanced online advertising transparency requirements, notice and action mechanisms, certain safeguards and the possibility to challenge platforms’ content moderation decisions.¹⁵⁹⁷ The European Data Protection Supervisor welcomed the initiative but at the same time stressed the importance of protecting individuals, for example from targeted online advertising or from automated decision making and profiling in the framework of so-called recommender systems.¹⁵⁹⁸ The European Parliament adopted the Digital Services Act in July 2022.¹⁵⁹⁹ it imposes a ban on dark patterns and online advertising activities targeting minors, or those based on sensitive personal data, and introduces strict obligations for very large online platforms and very large online search engines¹⁶⁰⁰ such as the establishment of an independent compliance function, yearly independent audits, systemic risks assessments as regards the design, functioning and use of their services, including algorithmic systems, or granting access to data to the authorities for the purposes of monitoring and assessing compliance with the DSA, including the explanation of the logic, design, testing and functioning of algorithmic systems.¹⁶⁰¹

7.1.5. Proposal for a Digital Markets Act

The DMA applies to organizations which qualify as so-called gatekeepers, for example, search engines, social networking and video-sharing platforms, online intermediation services, and cloud computing services, and aims at ensuring a higher degree of competition and a fairer business environment.¹⁶⁰² The Digital Markets Act and Digital Services Act both have extraterritorial effect, and the DMA will require gatekeepers to refrain from unfair behaviors such as blocking users from uninstalling any pre-installed software or apps or restricting users from accessing services that may have been acquired outside of the gatekeeper's platform.¹⁶⁰³ The Digital Markets Act will furthermore ban the combination and cross-use of personal data collected during the use of a service for the purposes of another service offered by the gatekeeper¹⁶⁰⁴, ensure access for business users to their marketing or advertising performance data as well as effective portability and continuous and real-time access to data provided or generated by end users, complementing the GDPR's right to (personal) data portability.¹⁶⁰⁵ The EDPS underlined that the DMA should enhance consent mechanisms, clarify the scope of the data portability obligation, consider effective anonymization, and introduce (minimum) interoperability standards,¹⁶⁰⁶ and once again called for a structured approach between all authorities responsible for compliance with the Digital Services Act, the Digital Markets Act as well as all other applicable regulations. As part of the triologue discussions, a provisional political agreement¹⁶⁰⁷ was reached between the European Parliament and the Council of the European Union in March 2022.

¹⁶⁰² DMA requirements are summarized by the European Commission at their website, available at https://ec.europa.eu/info/strategy/priorities-2019-2024/europe-fit-digital-age/digital-markets-act-ensuring-fair-and-open-digital-markets_en. Retrieved October 17, 2021.

7.1.6. Proposal for a Directive on Copyright

In early 2019, the European Parliament, the Council of the EU and the Commission agreed on new copyright rules¹⁶⁰⁸ in order to be fit for the digital era and bring tangible benefits to all creative sectors, such as the press, researchers or cultural heritage institutions as well as citizens.¹⁶⁰⁹ The proposal turns the established notice-and-takedown-principle on its head and introduces a new platform liability regime: service providers have to take certain efforts to ensure the unavailability of copyright protected work, and one of the solutions for this purpose are so-called upload filters. This sounds like a fair distribution of revenues from the online use of copyright works to the benefit of creators and publishers. But this initiative faced a lot of criticism¹⁶¹⁰ as it is feared that any such filtering might lead to censorship or even guardianship and disenfranchisement of users as well as further strengthening of data monopolies. Smaller platforms, due to cost and efforts involved with the implementation of upload filters, will likely use centralized filtering mechanisms offered by third parties, i.e., companies which already invested time and money in corresponding technology. Some thus believe that, by requiring Internet platforms to perform automatic filtering all of the content that is uploaded by individuals, this may lead to a transformation of the Internet from an open platform into a tool for automated surveillance and control.¹⁶¹¹ Given the specific technology needed for such filters and owing to the fact that a volume of data has to be processed, it seems likely that a huge part of the data traffic will run through the hands of a few large providers,¹⁶¹² which is why some fear that this would lead to the emergence of a data oligopoly.¹⁶¹³ Another concern is that, because content filter technology is costly, small platforms might opt for data-for-service collaborations with Big Tech players in such a way that user data is offered in return for filtering services – an agreement that would probably be justified by the fact that a compliance requirement must be met. Finally, one further option has already been communicated by certain content-

service-providers: the exclusion of European users with the help of so-called Geo-Blocking.¹⁶¹⁴ Moreover, filters will have to be programmed in a manner to also take into consideration relevant specific legal exceptions such as quotations, criticism, or parody¹⁶¹⁵ to function properly. They will also be able to distinguish whether film material was used by a film critic, which is legal, or by a user attempting to illegally distribute the film, which is inadmissible. Either way – the collection of such meta-data leads to the fact that platforms using such filters would be considered controllers that process personal data.¹⁶¹⁶ The question that arises in this context is the legality of such processing activities and the compatibility of centralized filtering mechanisms with the Charter of Fundamental rights. In line with the principle of proportionality laid down in Article 52 (1) of the Charter, the Regulation requires all legal obligations to be proportionate with respect to the legitimate aim which is pursued.¹⁶¹⁷ But if one compares the filtering obligation under Article 17 (4b, c) of the Copyright Directive to existing CJEU case law with regard to fundamental rights as stipulated in Article 7 (the right to private life) and Article 8 (the right to protection of personal data) of the Charter, it is questionable whether the obligation to use upload filters meets the requirements of a balance between the right to intellectual property, the freedom to conduct business and the right to protection of personal data.¹⁶¹⁸ In the famous Schrems decision,¹⁶¹⁹ the CJEU stressed that legislation which grants public bodies generalized access to the content of communication violates both, the principle of proportionality and the right to private life. The CJEU concluded that “legislation permitting the public authorities to have access on a generalized basis to the content of electronic communications must be regarded as compromising the essence of the fundamental right to respect for private life, as guaranteed by Article 7 of the Charter.” Since the Copyright Directive deals with the processing of communication between a user and the platform, some claim that this directive may conflict with the freedom of expression because copyright mechanisms do not respect fair use as they are often unable to recognize parody or quotation, i.e., existing freedoms and / or legal

¹⁶¹⁴ Twitch’s CEO brought the exclusion of EU users into play. exceptions.¹⁶²⁰ Another problem is that the CJEU addressed public bodies, but the Copyright Directive takes private companies into duty, this way shifting the protection of individual freedoms to the private sector or, rather algorithms that shall have the capacity to decide upon the admissibility of uploading content.

7.1.7. Proposal for a renewed NIS Directive

Only two years after its implementation, the EU Commission proposed¹⁶²¹ an update of the Directive on Security of Network and Information Systems, also known as “NIS2 Directive”. Like the present Directive on Security of Network and Information Systems, the new NIS2 Directive aims at strengthening security requirements, but it also aims at streamlining reporting obligations and introduces more stringent supervisory measures and stricter enforcement requirements, including harmonized sanctions across the EU, and furthermore addresses the management of supply chains risks.¹⁶²² The current NIS Directive¹⁶²³ (also known as the Cyber-security Directive) applies to operators of essential services such as water supply or energy as well as digital service providers, including providers of cloud computing services and online services. The present NIS Directive has been criticized for its scope and application,¹⁶²⁴ and the proposed¹⁶²⁵ NIS2 Directive takes up this criticism and does not distinguish between operators of essential services and digital service providers: it expands the scope of the present Directive by adding new sectors in accordance with their criticality for the economy and society. Cloud service providers are now categorized as essential entities, which is a major change and adds to the fact that the use of cloud computing for Big Data and AI is governed by many data privacy and security laws. Moreover, fines of up to 10 million Euro or 2 % of the total worldwide turnover (whichever is

higher) are foreseen, and non-compliant entities risk that their relevant authorizations are suspended or have senior management suspended from exercising managerial functions.¹⁶²⁶

7.1.8. Proposal for a Directive on the Resilience of Critical Entities

The proposed NIS2 Directive should not be seen in isolation, but in the context¹⁶²⁷ of other initiatives to enhance the resilience of critical systems, and for which the European Union established the European Program for Critical Infrastructure Protection (EPCIP) already in 2006¹⁶²⁸ with the overall goal to increase the level of security and decrease the number and severity of incidents including data breaches. Consequently, the European Commission proposed another directive to replace the current Critical Infrastructure Directive,¹⁶²⁹ the Directive on the resilience of critical entities:¹⁶³⁰ under this directive EU Member States must, among other things, designate authorities, identify nationally critical infrastructures and services and evaluate their vital functions which are in scope of the directive; critical entities would be subject to specific oversight and would have to implement appropriate technical and organizational measures and conduct risk assessments.¹⁶³¹

7.1.9. Proposal for a Cyber Resilience Act

The proposal for a “Regulation on horizontal cybersecurity requirements for digital products and ancillary services” (Cyber Resilience Act)¹⁶³² has been proposed against the background that hardware and software products are increasingly subject to successful cyberattacks, which may be due to a variety of reasons, ranging from insufficient user knowledge, preventing users from either choosing products with appropriate cybersecurity properties or using products in a secure manner, to inadequate and / and

Retrieved December 29, 2022.

inconsistent provision of security updates which cause vulnerabilities, or.¹⁶³³ From a legal perspective, the problem was that, while “existing internal market legislation applies to certain products with digital elements, most of the hardware and software products are currently not covered by any EU legislation tackling their cybersecurity. In particular, the current EU legal framework does not address the cybersecurity of non-embedded software, even if cybersecurity attacks increasingly target vulnerabilities in these products, causing significant societal and economic costs.”¹⁶³⁴ This new proposal is highly relevant in practice, because products with digital elements are on the rise, consequently, “new cybersecurity requirements would apply to all products that are either directly or indirectly connected to another device or network, including non-embedded software. Heightened requirements would apply to critical and highly critical products with digital elements. Requirements would include providing security support, software updates, and enhanced consumer information and transparency.”¹⁶³⁵

7.1.10. Proposal for a Cyber Solidarity Act

The proposal for a “Regulation of the European Parliament and of the Council laying down measures to strengthen solidarity and capacities in the Union to detect, prepare for and respond to cybersecurity threats and incidents” (Cyber Solidarity Act)¹⁶³⁶ has been published in April 2023. The Cyber Solidarity Act wants to establish a “European Cyber Shield” and focuses on incident detection, response capabilities, and situational awareness. It aims to improve the cyber resilience of critical entities, to promote information sharing about cyber incidents and vulnerabilities, and to create an EU-wide resource for incident management.¹⁶³⁷ The CSA will moreover promote the establishment of cross-border Security Operation Centers that shall serve as hubs for the collection and analysis of information on cybersecurity threats, incidents and tools from public bodies and private entities, and requires the European Commission to populate an “EU Cybersecurity Reserve” comprising a bench of “trusted providers” of private managed security services.¹⁶³⁸ In addition, the CSA requires private providers of

managed security services to support member states in the response and immediate recovery actions in cases of significant or large-scale cybersecurity incidents and the CSA foresees the testing of certain entities that are subject to NIS2 for potential vulnerabilities based on EU risk assessments.¹⁶³⁹ As a result, the Cyber Solidarity Act adds another layer to the increasingly complicated legal landscape of EU cybersecurity laws, and it remains to be seen how the CSA will intersect with other legal initiatives such as the revised Network and Information Security Directive, the Cyber Resilience and Cybersecurity Act.

7.1.11. 5G Security and Internet of Secure Things

As part of their cyber-security strategy, the European Union is also dealing with IoT and 5G, which many believe to be the next big¹⁶⁴⁰ thing despite increased infrastructure cost: this future mobile network will allow for better performance by processing a much higher volume of data and by connecting more devices to a single source,¹⁶⁴¹ and connectivity and capacity are key to Big Data applications. This initiative shows that the EU wants to lead efforts for a secure digitalization¹⁶⁴² and that there is awareness of the importance of security and resilience of IoT and investment in trustworthy digital technologies: this is truly needed since the number of cyber-attacks continues to rise and because society's digital transformation has been intensified by the COVID-19 crisis.¹⁶⁴³ The importance of security cannot be stressed enough: a hack by researchers affected numerous car manufacturers like BMW, Ferrari, Ford, Honda, Hyundai, Infiniti, Jaguar, Land Rover, Mercedes-Benz, Nissan, Porsche, Rolls Royce, Toyota, and others showed truly critical vulnerabilities, because it was possible to take full (remote) control over user accounts, access personal data, change ownership, or lock users out, to only name a few of the detected problems.¹⁶⁴⁴

7.1.12. Proposal for a review of the Directive on the Re-use of Public Sector Information

In the framework of Big Data discussions and the use of Artificial Intelligence in Industry 4.0, people tend to forget that not only Big Tech companies are data-driven; truth is, the public sector is one of the most data-intensive sectors. This erroneous perception is confirmed by the fact that this proposal attracted much less attention in contrast to the proposal for a copyright reform. The reason for this new proposal was the intention to create a “common data space”¹⁶⁴⁵ within the European Union, and consequently, the European Commission adopted a new proposal¹⁶⁴⁶ for a revision of the PSI Directive. This proposal aims to overcome existent (market entry) barriers which prevent the re-use of public sector information, especially for data which are generated by utilities and the transport sector as well as research data resulting from public funding. Such (real-time) data has tremendous re-use potential, and that is particularly true for dynamic data since this type of data is believed to be one of the most commercially valuable types of data.¹⁶⁴⁷ Due to the fact that the proposal suggests a full re-use of public sector information, it is questionable how this relates to the principle of purpose limitation GDPR sets forth. The protection of personal data is recognized as a fundamental right and therefore, it cannot be simply overruled. But the proposal addresses this problem as it provides for an exception to the scope of the PSI Directive for reasons relating to the protection of personal data.¹⁶⁴⁸ However, problems may arise given that other terms are used¹⁶⁴⁹ and because definitions of terms are not the same.¹⁶⁵⁰ It was moreover suggested to introduce mandatory data protection impact assessments for specific sectors dealing with sensitive data such as the health sector which take the conditions for re-use into account.¹⁶⁵¹ Even though further developments have to be awaited, it seems already clear at this stage that certain (foreseeable) challenges prevail in the context of re-use of public sector information, for example, the potential weakening of purpose limitation and the risk of loss of transparency.

¹⁶⁴⁵ Details are provided by the European Commission, available at <https://ec.europa.eu/digital-single-market/en/proposal-revision-public-sector-information-psi-directive>. Retrieved October 17, 2021.

7.1.13. Proposal for a Public Sector Interoperability Act

Another initiative is important in the context of the use and handling of public sector information: In late 2022 the European Commission adopted a proposal¹⁶⁵² for an “Interoperable Europe Act” to reinforce the interoperability of the public sector in the EU. It aims to enhance the ability of administrations to cooperate and make public services function across borders, sectors, and organizations, in brief: make EU legislation fully digital-ready and interoperable-by-design.¹⁶⁵³ The Commission published Questions and Answers on the proposal,¹⁶⁵⁴ and a press release¹⁶⁵⁵ in which the Commission explains that the Interoperable Europe Act introduces:

- *“A structured EU cooperation where public administrations, supported by public and private actors, come together in the framework of projects co-owned by Member States, as well as regions and cities;*
- *Mandatory assessments to evaluate the impact of changes in information technology (IT) systems on cross-border interoperability in the EU;*
- *The sharing and reuse of solutions, often open source, powered by an ‘Interoperable Europe Portal’ – a one-stop-shop for solutions and community cooperation;*
- *Innovation and support measures, including regulatory sandboxes for policy experimentation, GovTech projects to develop and scale up solutions for reuse, and training support.”*

7.1.14. Proposal for a European Health Data Space

In early 2022, the European Commission published a proposal¹⁶⁵⁶ for the creation of the “European Health Data Space” (EHDS). If adopted, the proposal would foresee the creation of an EU-wide

¹⁶⁵² The text of the proposal for a regulation of the European Parliament and of the Council laying down measures for a high level of public sector interoperability across the Union (Interoperable Europe Act) is available at <https://op.europa.eu/en/publication-detail/-/publication/f53505b9-672f-11ed-b14f-01aa75ed71a1/language-en>. infrastructure¹⁶⁵⁷ that allows to link health data sets for practitioners, researchers, and industry.¹⁶⁵⁸ The proposal aims to facilitate the creation of a “European Health Union” and to “enable the EU to make full use of the potential offered by a safe and secure exchange, use and reuse of health data.”¹⁶⁵⁹ The European Commission stresses the aim of creating an “internal market for personal health data and digital health products and services” by promoting “the free, cross-border flows of personal data.”¹⁶⁶⁰ The European Data Protection Board and the European Data Protection Supervisor issued a joint opinion¹⁶⁶¹ on the EHDS proposal which expresses concerns in relation to the proposal from a data protection perspective, which underlines that the secondary use of personal information shall be subject to prior consent of the data subject. The EDPB Chair said that the description of individuals’ rights the proposal is not consistent with the GDPR and that it is of utmost importance that data subject rights are by no means undermined by this proposal, and that there may be a substantial risk of legal uncertainty if the interplay of the different rights between the proposal and the GDPR is not clarified.¹⁶⁶² The EDPS Supervisor added that health data processed by wellness apps may reveal particularly sensitive information such as religious orientation and that digital health applications should therefore be excluded from being made available for secondary use.¹⁶⁶³ The fact that the use of health data may even put individuals at risk of prosecution shows that this type of information truly is of sensitive nature.¹⁶⁶⁴

¹⁶⁵⁷ However, not all Member States are maintaining electronic patient records, meaning that corresponding steps towards digitalization would be a prerequisite.

¹⁶⁵⁸ The law firm Kinast reports on the EHDS in their July 21, 2022 blog post: The Commission’s Proposal for the European Health Data Space raises data protection concerns, available at <https://www.privacy-ticker.com/the-commissions-proposal-for-the-european-health-data-space-raises-data-protection-concerns/>. 7.1.15. Proposal for a revised Product Liability Directive

In September 2022, the European Commission published its proposal¹⁶⁶⁵ for a directive on liability of defective products. The reason is that the existing Product Liability Directive¹⁶⁶⁶ was adopted in 1985, nearly 40 years ago, at a time where Big Data and AI applications as we know them today did not exist. Consequently, the proposal aims to bring the EU's liability regime up to speed with the digital age by introducing new provisions addressing the liability of a category of products emerging from new digital technologies such as Internet of Things or Artificial Intelligence. For example, the proposal:

- *clarifies that software must be considered a product in the scope of the directive;*
- *alleviates the burden of proof for victims under certain circumstances;*
- *introduces liability for defective products when refurbished and placed back on the market as well as when manufactured outside the European Union;*
- *extends the nature of damage to psychological health and loss or corruption of data; and*
- *considers as product defectiveness the lack of software updates under the manufacturer's control as well as the failure to address cybersecurity vulnerabilities.*¹⁶⁶⁷

The review of this directive shall be welcomed, because the legal framework needs to reflect specific implications Big Data and AI applications may have. The same applies to the General Product Safety Directive¹⁶⁶⁸ which should also be reviewed against modern threats as well as present cyber-security standards.¹⁶⁶⁹ AI-driven products should be examined in the light of product liability to properly address the risk of accidents and damage.¹⁶⁷⁰

¹⁶⁶⁵ The text of the proposal for a new Product Liability Directive is available at <https://www.europarl.europa.eu/legislative-train/theme-a-europe-fit-for-the-digital-age/file-new-product-liability-directive#:~:text=The%20European%20Commission%20published%20a%20proposal%20for%20a,and%20global%20value%20chains%20on%2028%20September%202022>. 7.1.16. Proposal for an Artificial Intelligence Act

Following their above-mentioned White Paper on AI and a public consultation period, the European Commission published its proposal for a regulation¹⁶⁷¹ on a European approach for Artificial Intelligence in early 2021:¹⁶⁷² “The Commission is proposing the first ever legal framework on AI which addresses the risks of AI and positions Europe to play a leading role globally.” These landmark rules are an ambitious attempt to regulate AI and represent a major step towards a comprehensive legal framework for Artificial Intelligence, setting out a cross-sectoral regulatory approach for the use of AI with the aim to pave a way to both, ethical use of AI technologies and ensuring that the EU remains competitive in this regard.¹⁶⁷³ It is important to note that the new regulation shall not replace existing rules; the Commission stresses that the present legal framework however should be improved.¹⁶⁷⁴ As any regulation, the rules would apply directly with no need for further implementation at member state level, and this shows that the Commission wants to establish consistent rules for AI and improve legal certainty. However, the fact that the regulation will have to pass the European Parliament and the European Council makes it likely that there will be adjustments, also because various stakeholders’ standpoints and interests on such a complex topic as AI will have to be considered; another factor to consider is that the regulation will come into force 24 months after it has been adopted, it is questionable whether some of the provisions will be overtaken by technological progress before they even apply, meaning that the regulation, or parts thereof, would perhaps not be future-proof.¹⁶⁷⁵ The Artificial Intelligence Act defines AI as: “any software that is developed with one or more of the techniques and approaches listed in Annex I and can, for a given set of human-defined objectives, generate outputs, such as content, predictions, recommendations, or decisions influencing the environments they interact with.” This definition can be questioned from a technical point of view,¹⁶⁷⁶ and there is no agreed definition of AI amongst experts in industry or law, there are only common elements in various

¹⁶⁷¹ If adopted by the European Parliament and Council, the Artificial Intelligence Act would apply directly across the EU.

definitions (such as digital, technology, learning, reasoning),¹⁶⁷⁷ and another factor to consider is the dual-use characteristics of AI: as much as AI can serve the good, it can also serve the bad.¹⁶⁷⁸ It also must not be forgotten that what was considered AI ten years ago might not be considered AI today. This broad definition is intended to determine the scope of regulation and to be technology-neutral and as future-proof as possible¹⁶⁷⁹, but that also means that software which is traditionally not necessarily classified as AI would be covered by the new regulation. The extent to which the terms “software”, “AI system”, etc. currently proposed in the AI Regulation can be further clarified is likely to be of crucial importance to the success of the AI Regulation Act since this will reduce remaining ambiguities.¹⁶⁸⁰ Moreover, just like GDPR, the Artificial Intelligence Act will apply to the private and public sector, and more importantly, the draft AI Regulation intends to capture all parties involved in the AI value chain,¹⁶⁸¹ that is:

- *“Providers (i.e., entity / person that develops or has an AI system developed) who place AI systems on the EU market or put them into service in the EU irrespective of whether they are established within the EU. (...) Where the provider is not established in the EU and where an importer cannot be identified, an authorized representative in the EU must be appointed;*
- *Users of AI systems (i.e., the entity / person using an AI system) established in the EU – except where the AI system is used in the course of a personal non-professional activity;*
- *Providers and users of AI systems established outside the EU where the output produced by the AI system is used in the EU;*¹⁶⁸²
- *Manufacturers of products are covered and are responsible for compliance as if they were the provider of the high-risk AI system;*
- *Distributors, importers, users and other third parties will also be subject to providers’ obligations if they place a high-risk AI system on the market or into service under their name*

*or trademark, modify the intended purpose of a high-risk AI system already on the market or in service or make a substantial modification to a high-risk AI system. In that case, the original provider is relieved of responsibility.”*¹⁶⁸³

The implications that come with further terminology and definitions should not be underestimated: there are voices that say that, once all of EU’s legal initiatives enter into force, one and the same company could be both, “controller” and “processor” under GDPR, “data holder” under the DGA and “distributor” under the AI regulation, meaning that consistency would be substantially hampered.¹⁶⁸⁴ Like GDPR, Article 71 of the new regulation allows for high fines of up to 30,000,000 Euro or of up to 6% of total annual worldwide turnover, whichever is higher, depending on the type of violation: the highest fines will apply to infringements on prohibited practices, medium-range fines are foreseen for non-compliance, and the lowest fines apply to the supply of incorrect, incomplete or misleading information to notified bodies and competent authorities. Unlike the GDPR, the draft regulation does not provide for a right to compensation, which, on the one hand, may provide comfort. On the other hand, that does not mean that a private right of action is not given if the conditions of GDPR Art. 82 are met. Like the GDPR, the Artificial Intelligence Act will have extraterritorial effect, the regulation will apply to users of AI systems located within the EU as well as providers and users of AI systems located outside the EU where the output is used in the EU and providers which place on the market or put into service AI systems in the EU regardless of where they are located.¹⁶⁸⁵ This may lead to the so-called “Brussels-effect”¹⁶⁸⁶ which guides the way companies are doing business, because multinational organizations would adjust their global operations to EU standards to be compliant. Apart from the extraterritorial scope and high fines, various other provisions of the regulation echo the GDPR, for example the fact that the Artificial Intelligence Act foresees for incident notifications or the fact that certain accountability, documentation and enforcement provisions apply:¹⁶⁸⁷ as for the latter, the Commission’s proposal foresees for the creation of the European AI Board that would be entrusted with various tasks such as sharing of best practices, ensuring consistent application and harmonized implementation of the

regulation and issuance of opinions and recommendations.¹⁶⁸⁸ It is important to note that the Board will be complemented by a public database of all stand-alone high risk AI systems: this is an interesting development many welcome as it represents a new dimension of transparency¹⁶⁸⁹ different from mere information obligations under GDPR that can typically be described as one-time efforts addressed to data subjects as opposed to official bodies. The regulation is the first piece of legislation that is solely focused on Artificial Intelligence, i.e., identification, classification, documentation and monitoring of AI with a specific emphasis on high-risk AI. Even though the proposal does not define high risk, the proposal provides for criteria¹⁶⁹⁰ to be used to determine whether a system shall be classified as a high-risk application of AI, and the draft regulation also explains that risk shall be interpreted in line with existing product safety legislation. Content and structure of the proposal can be described as follows:¹⁶⁹¹ first, the scope of the new proposed rules is defined; second, the draft proposal explains which AI systems are considered unacceptable, for example due to violation of fundamental rights. Title III of the draft contains specific rules for high-risk AI systems. Title IV of the draft AI Act is concerned with transparency obligations for systems that interact with humans; title V explains the objective of the creation of an innovation-friendly legal framework, which demonstrates that the European Commission is aware of the potential of Artificial Intelligence. Title VI is about governance; title VII addresses the work of the Commission and national authorities. Title VIII and IX set forth reporting obligations for AI providers and promote the voluntary application of requirements that are applicable to high-risk systems to providers of non-high-risk AI systems. Finally, title XII foresees that the Commission regularly evaluates the need for a revision of Annex III and prepares regular reports on the review of the regulation.¹⁶⁹² In the explanatory memorandum within the draft proposal of the Artificial Intelligence Act, the Commission explains that the European Commission “puts forward the proposed regulatory framework on Artificial Intelligence with the following specific objectives:

- *Ensure that AI systems placed on the Union market are safe and respect existing law on fundamental rights and Union values;*

- *Ensure legal certainty to facilitate investment and innovation in AI;*
- *Enhance governance and effective enforcement of existing law on fundamental rights and safety requirements applicable to AI systems;*
- *Facilitate the development of a single market for lawful, safe and trustworthy AI applications and prevent market fragmentation.”*

The Artificial Intelligence Act thus wants to balance between protecting individuals and allowing for technological innovation¹⁶⁹³ based on balancing of risk. Unlike the low risk vs. high risk approach that was discussed in the Commission’s 2020 White Paper on AI, the regulation differentiates between various levels of potential risks posed by AI: the Artificial Intelligence Act sets forth a four-tiered risk framework that recognizes the varying levels of risk posed by AI systems to one’s health, safety, and / or fundamental rights and sets out proportionate requirements and obligations per risk level; in accordance with possible risks, each tier aims to set adequate requirements for providers and users of AI applications.¹⁶⁹⁴ The proposal starts with listing types of AI practices that are prohibited:¹⁶⁹⁵

- *“Placing on the market, putting into service, or using an AI system that deploys subliminal techniques beyond a person’s consciousness to materially distort a person’s behavior in a manner that causes that person or another person physical or psychological harm;*
- *Placing on the market, putting into service, or using an AI system that exploits vulnerabilities of a specific group of persons due to their age, physical or mental disability to materially distort the behavior of a person pertaining to the group in a manner that causes that person or another person physical or psychological harm;*
- *Placing on the market, putting into service, or using an AI system by public authorities or on their behalf for the evaluation or classification of the trustworthiness of natural persons with the social score leading to detrimental or unfavorable treatment that is either unrelated to the contexts in which the data was originally generated or unjustified or disproportionate;*
- *Use of “real-time” remote biometric identification (read: facial recognition) systems in publicly accessible spaces for law enforcement purposes, subject however to broad exemptions that, in turn, are subject to additional requirements, including prior authorization for each individual*

use to be granted by a judicial authority or an independent administrative body in the member state where the system is used.”

It is foreseeable that the latter point will lead to controversial discussion: fighting crimes is an argument that is regularly used in the context of technologies like video surveillance and more sophisticated techniques like (real-time) facial recognition, however, this needs to be balanced against individuals’ fundamental rights and freedoms. The European Data Protection Supervisor commented on the Artificial Intelligence Act that this is a welcomed initiative, but that ban on remote biometric identification in public space – a provision which was included in a previous leaked version of the regulation¹⁶⁹⁶ – is necessary.¹⁶⁹⁷ Moreover, this particular section of the draft has numerous exceptions, for example, targeted search for victims and prevention, detection, localization or prosecution of certain crimes.¹⁶⁹⁸ In addition, the draft does not cover other purposes (e.g. non-law-enforcement), other uses (e.g. non-publicly accessible spaces) or other players (e.g. private sector uses of biometric identification technologies), which leads to legal uncertainty in relation to other existing laws, namely GDPR and the Law Enforcement Directive as well as national laws.¹⁶⁹⁹ Finally, the example of Clearview AI, which is an app developed by a private company that allows to identify individuals based on a single picture, shows how controversial the discussion around the use of biometric information is when it comes to data protection: Clearview’s technology has been used by police in many countries (e.g., Australia¹⁷⁰⁰), but at the same time, data protection supervisory authorities in several countries including the United Kingdom, France, Italy, Greece and Austria are dealing with complaints¹⁷⁰¹ or already issued fines (e.g.,

Sweden)¹⁷⁰² or ordered the (partial) deletion of individual's biometric information (e.g., Germany).¹⁷⁰³ Against this background, this particular section within the draft AI Regulation faced harsh criticism; some institutions comment that the draft Act “missed an opportunity to clearly draw red lines and close loopholes”.¹⁷⁰⁴ Others point to the fact that facial recognition has already been banned in many U.S. states,¹⁷⁰⁵ which is remarkable insofar as the U.S.A and the EU historically took a different approach on privacy: not the European principle of prohibition subject to permission but the idea that everything is allowed as long as it is not forbidden. As for high-risk AI applications, these can roughly be divided into high-risk sectors (e.g., healthcare, employment, finance) and high-risk purposes (e.g., automated driving, energy distribution, recruitment), for example:¹⁷⁰⁶

- *Management and operation of critical infrastructures such as traffic and electricity;*
- *Education or Vocational training, for example determining access to education;*
- *Employment (i.e., during the recruitment, promotion, or termination process;*
- *Evaluation of access to essential resources, benefits, and services;*
- *Law enforcement (e.g., assessing risks of re-offending);*
- *Immigration and border control and asylum.*

The following general requirements will apply to high-risk AI:¹⁷⁰⁷ human oversight, adequate risk management, appropriate transparency obligations, documentation to allow for compliance assessments, logging of activities to ensure traceability as well as a high level of accuracy, robustness and security

and the use of high-quality training, validation and testing data sets.¹⁷⁰⁸ High risk AI will be subject to certain restrictions; in particular, conformity assessments will be required, meaning that certification will become mandatory for such AI applications.¹⁷⁰⁹ In this regard, the EU takes a “cradle to grave approach:”¹⁷¹⁰ high-risk AI systems will be subject to review throughout their life cycle, including mandatory risk management, documentation requirements, as well as post-market monitoring and incident reporting. Many welcomed the draft AI’s proposal to create an EU database on high-risk AI systems¹⁷¹¹ that includes information on (see Annex VIII) the AI system (including status, trade name and any other additional reference allowing for identification as well as information on the Member States in which the AI system is to or has been placed on the market, put into service or made available; the type, number and expiry date of the certificate issued by the notified body including; a description of the intended purpose of the AI system; a copy of the conformity certificate (where required); a URL for additional information (optional); electronic use instructions and provider information. It is important to note that the majority of obligations applies to so-called providers, but Chapter 2 and 3 of Title III also establish obligations for importers (covered under Article 26 of the draft AI Act) and distributors (covered under Article 27 of the draft AI Act) as well as users (covered under Article 29 of the draft AI Act),¹⁷¹² and this shows that the regulation aims at capturing all parties involved in the making available in the market and use of AI.¹⁷¹³ AI systems that are used as a products or safety components, for example in medical devices, are listed in Annex II and will require to third-party ex-ante assessments, meaning that external entities will review the AI application before it can be put into service;¹⁷¹⁴ other high risk AI systems specified in Annex III of the draft regulation will require first-

party ex-ante conformity assessments (i.e. self-assessments prior to their use), as well as ex-post quality and risk management assessments and post-market monitoring. As regards conformity assessments, reference is made to existing requirements in EU product safety laws (see Annex II),¹⁷¹⁵ however, the AI Regulation's self-assessment-approach faced criticism: while industry often prefers a deregulated landscape when it comes to using technology, because it is believed that regulation stifles innovation,¹⁷¹⁶ legislative history in the course of industrial revolutions and across various sectors, be it transportation, chemical engineering, communications, aviation or biotechnology and digitization has shown that voluntary codes or self-regulation may simply not work, and that regulatory discussions should not primarily focus on specific harms or individual risks but also take the systemic and structural risk of Artificial Intelligence into consideration.¹⁷¹⁷ Some say that time will tell whether voluntary codes and ethics standards will be sufficient to mitigate the risks posed by AI but some believe that where AI applications have an impact on human rights, legislation is required to protect those human rights.¹⁷¹⁸ Finally, the Artificial Intelligence Act furthermore sets forth that minimal or no risk AI (e.g., spam filters) will be permitted with no restrictions, but providers of such AI applications are encouraged to adhere to voluntary codes of conduct or apply voluntary labeling schemes.¹⁷¹⁹ AI systems which pose a limited risk (e.g. chat-bots) – perhaps the majority of applications – will be subject to transparency obligations to allow for informed decisions.¹⁷²⁰

7.1.17. Proposal for an AI Liability Directive

In late 2022, the European Commission published a proposal for a directive on adapting non-contractual civil liability rules to artificial intelligence, the AI Liability Directive,¹⁷²¹ which is intended to complement the EU AI Act. For consistency purposes, the AI Liability Directive uses the same

definitions¹⁷²² as the AI Act. In the explanatory memorandum on the AI Directive, the Commission shared the reasons underlying the choice to use the directive as the selected legislative instrument:¹⁷²³ “non-binding soft law (e.g., recommendations) would not be complied with as intended and therefore not have the desired effect. A set of rules directly applicable to all Member States (regulation), comparatively, would be too strict in relation to the scope of tortious liability, which is based on specific and long-established legal traditions of each Member State. The choice of the directive therefore leaves more flexibility for the internal transposition to the Member States while requiring more rigid compliance than its soft-law counterparts.” The purpose of the AI Liability Directive proposal is to ensure uniform rules apply for “certain aspects of non-contractual civil liability for damage caused with the involvement of AI systems.”¹⁷²⁴ If adopted, the proposals will change the liability rules for AI software and systems: the draft AI Liability Directive will apply to damages that occur two years or more after the Directive enters into force; five years after its entry into force, the Commission will consider the need for rules on no-fault liability for AI claims.¹⁷²⁵ The proposal intends to “respond to the challenges identified and to improve the functioning of the internal market by laying down uniform rules for certain aspects of non-contractual civil liability for damage caused with the involvement of AI systems. The proposal addresses the specific difficulties of proof linked with AI and ensures that justified claims are not hindered. The Commission asked for feedback on its proposal.”¹⁷²⁶ Prior to this initiative, the Commission discussed¹⁷²⁷ specific safety and liability implications of Artificial Intelligence; the European Parliament called for a legal framework for civil liability claims and for imposing a regime of strict liability on operators of high-risk AI systems.¹⁷²⁸ The AI Liability Directive AI Directive aims to ease the claimant’s burden of proof with the help of two new key rules for attributing liability in non-contractual fault-based claims where an AI system is intrinsically

Retrieved January 7, 2023.

involved:¹⁷²⁹ a rebuttable presumption of causality, and a right to evidence. This means that under the new AI Liability Directive, courts will have the power to order providers or users of high-risk AI systems to disclose and / or preserve information about their systems. If such a disclosure conflicts with trade secrets, the court will may take measures necessary to preserve the confidentiality of that information during the proceedings.¹⁷³⁰ This approach shall be highly welcomed from an individual’s perspective: Claims for harm caused by AI applications can be difficult, because AI systems are opaque, users do not have enough insight into how that AI system works, meaning that they are unable to provide proof that a specific defect or malfunction was the cause of the harm. While the AI Act sets out certain documentation and information requirements for AI systems, there is no specific right under the AI Act for a person injured by that system to access that information, which would be critical in substantiating a claim for compensation.¹⁷³¹ Therefore, easing the burden of proof through a (rebuttable) presumption of causality together with increased transparency through disclosure of AI-related evidence will be truly helpful as it would significantly lower evidentiary hurdles for victims injured by AI-related products or services to bring civil liability claims.¹⁷³² However, the problem is that the rebuttable presumption “only applies if a national court finds it excessively difficult for the victim-claimant (or any other claimant) to prove the causal link and a number of specific conditions are met. These include that:

- *the claimant has proven, or the court has presumed, the fault of the defendant, or of a person for whose behavior the defendant is responsible, consisting in the failure to comply with a duty of care intended to protect against the damage that has occurred (e.g., a duty of care under the AI Act or other national or European legislation);*
- *it is reasonably likely that, based on the circumstances of each case, the defendant’s negligent conduct affected the output produced by the AI system or the AI system’s inability to produce an output; and*
- *the claimant has proved that the output produced by the AI system or the AI system’s inability to produce an output caused the damage.*¹⁷³³

Retrieved January 7, 2023.

And there are further challenges when claims relate to a high-risk AI system:¹⁷³⁴ “to satisfy the first condition above, the claimant has to demonstrate the defendant did not comply with these requirements, including high quality training data sets, transparency and human oversight of the system, and appropriate levels of accuracy, robustness and cybersecurity. In addition, if the defendant can demonstrate there is sufficient evidence and expertise accessible to the claimant so that it can prove the causal link, the presumption is also rebutted.” Lastly, the presumption will only apply where the court considers it excessively difficult for the claimant to prove the causal link. From an individual’s perspective, the question is “how is an injured party supposed to know in advance when evidence is excessively difficult to adduce, or that he reasonably has evidence and expertise to prove causation?”¹⁷³⁵ It therefore seems that civil procedural law with its complex relationship between burden of proof and presentation, facilitation of evidence, etc. will be decisive in the end;¹⁷³⁶ even though the reasoning behind the choice to use the directive as the selected legal instrument is comprehensible, it involves a risk of fragmentation and legal uncertainty due to national legal latitudes which contradicts the overall goal to harmonize the legal landscape in the context of AI.

7.2. Considerations for international data transfers

Owing to the fact that processing of personal data in many cases cannot be limited to a single country or the European Union / the European Economic Area and a small number of non-EU countries,¹⁷³⁷ rules are needed to serve as standards and safeguards for international data transfers.¹⁷³⁸ At present, a diversified toolkit of mechanisms to transfer data to third countries exists such as, for example, a set of Standard Contractual Clauses (SCCs),¹⁷³⁹ Binding Corporate Rules¹⁷⁴⁰ as well as several adequacy decisions.¹⁷⁴¹ GDPR Article 45 (9) makes clear that pre-GDPR adequacy decisions remain in force. One

of the well-known legal instruments in this regard was the so-called Privacy Shield.¹⁷⁴² The EU-US Privacy Shield was adopted in 2016¹⁷⁴³ and reviewed on an annual basis¹⁷⁴⁴ to ensure a constant level of adequacy for the protection of personal data. On the one hand, businesses view this framework as it brings legal clarity; on the other hand, the EU-US Privacy Shield, like its precursor “Safe Harbor”,¹⁷⁴⁵ faced criticism – already the European Parliament passed a non-binding resolution in which it asked the European Commission to suspend the Privacy Shield framework as it fails to provide an adequate level of protection.¹⁷⁴⁶ Interestingly, even though the discussion around data transfers is going on for many years, it is often overlooked that the GDPR does not provide for a legal definition of the notion transfer of personal data to a third country or to an international organization. Therefore, the EDPB issued guidelines to clarify when the requirements of GDPR chapter V shall be applied and identified three cumulative criteria to qualify a processing operation as a transfer:¹⁷⁴⁷

- *A controller or a processor (“exporter”) is subject to the GDPR for the given processing;*
- *The exporter discloses by transmission or otherwise makes personal data, subject to this processing, available to another controller, joint controller, or processor (“importer”);*
- *The importer is in a third country, irrespective of whether or not this importer is subject to the GDPR for the given processing in accordance with Article 3 or is an international organization.*

If the three criteria as identified by the EDPB are met, there is a transfer and Chapter V of the GDPR is applicable. This means that the transfer can only take place under certain conditions, such as in the context of an adequacy decision from the European Commission (Article 45) or by providing appropriate safeguards (Article 46).

7.2.1. EU-US Privacy Shield framework

The Privacy Shield has in fact been invalidated by the European Court of Justice in summer 2020¹⁷⁴⁸ because the U.S. does not have an adequate level of data protection given that authorities have administrative access powers and due to the lack of legal protection options for EU citizens. While the appropriateness of Standard Contractual Clauses has been confirmed, the protection of personal data in the context of U.S. national security has been questioned.¹⁷⁴⁹ Consequently, a coalition of civil society groups sent a letter to President Biden “urging the administration to ensure that any new transatlantic data transfer deal is coupled with the enactment of surveillance reforms and comprehensive data protection legislation” since otherwise, concerns about data transfers to the United States will remain.¹⁷⁵⁰ As a reaction to the invalidation of the Privacy Shield, many national supervisory authorities issued (divergent) guidance¹⁷⁵¹ to help with “transfer impact assessments”.¹⁷⁵² Companies are left with a lot of homework with regards to vendor screenings to demonstrate that they evaluated service suppliers processing their (employee, customer) data abroad, because there are more and more regulator decisions which underline the inadmissibility of data transfers to the U.S.: already in April 2021, the supervisory authority of Portugal, who specifically referred to the “Schrems II” decision, issued a resolution which required the National Institute of Statistics to suspend, within twelve hours, the transfer of data collected as part of the 2021 census surveys to the U.S. or any other third country without adequate data protection.¹⁷⁵³ The European Data Protection Supervisor issued a decision against the European Parliament after EP Members alleged that the Parliament’s use of cookies violated data protection law, including requirements regarding the transfer of personal data outside of the EU.¹⁷⁵⁴ Shortly after the EDPS’ decision, the Austrian regulator took a similar position in the framework of Google Analytics in

a complaint that was initiated by Max Schrems' NGO "None of Your Business".¹⁷⁵⁵ Meanwhile, the EDPB also provided their opinion on the EU-US Data Privacy Framework.¹⁷⁵⁶ However, what is often overlooked in the context of the Schrems II decision, is that the decision not only affects data transfers to the USA: in the absence of an adequacy decision by the European Commission, the ECJ requires data exporters to assess whether an equivalent level of protection for personal data exists in the respective third country prior to the transfer, and in this context, the question arises as to what significance Convention No. 108 and No. 108+ plays in the examination of the level of protection in third countries that are party to this international agreement.¹⁷⁵⁷ It therefore makes sense to compare GDPR requirements with respect to an „equivalent level of protection“ with the provisions of Convention No. 108+.¹⁷⁵⁸

7.2.2. Binding Corporate Rules and Standard Contractual Clauses

Together with Binding Corporate Rules which some consider the “gold standard for international data transfers”,¹⁷⁵⁹ Standard Contractual Clauses have been and will be a major legal instrument for international data transfers. As a follow-up to the Privacy Shield decision, SCCs have been updated – and widely commented at local¹⁷⁶⁰ and EU level¹⁷⁶¹ – to reflect some of the concerns that were raised in the context of the decision. However, the path forward may still not be crystal clear as the European Commission and Ireland's data regulator are investigating if the proposed new Standard Contractual

Clauses could cause complications when used under Irish law.¹⁷⁶² Developments are generally very dynamic in this area: the EDPB and EDPS commented on the European Commission’s new framework and issued a joint statement in which they requested various amendments¹⁷⁶³ which some consider substantial revisions.¹⁷⁶⁴ The EU is not the only institution that deals with SCCs; the UK prepared a bespoke set of Standard Contractual Clauses to facilitate transfers of personal data,¹⁷⁶⁵ and Brazil’s data protection law is another example of a legal framework that allows for international transfers of personal data based on contractual instruments such as binding corporate rules and standard clauses.¹⁷⁶⁶ China also worked on a “standard contract” as a means for cross-border data transfers,¹⁷⁶⁷ and there are further new data transfer mechanisms such as the Global CBPR Forum.¹⁷⁶⁸ Even though companies will have 18 months to substitute the European Commission’s new SCCs,¹⁷⁶⁹ it is very likely to become more difficult for controllers in future to match all requirements and fulfill all contractual obligations.

7.2.3. Derogations, Codes of Conduct, certifications

Apart from specific legal frameworks like the Privacy Shield or instruments like BCRs and SCCs, there are other legal possibilities for international data transfers:¹⁷⁷⁰ despite the exceptional character of

derogations under GDPR Art. 49 which require a restrictive application, it is worthwhile noting that derogations are being discussed as a further option for international data transfers.¹⁷⁷¹ As regards derogations under GDPR Art. 49, the International Association of Privacy Professionals published an overview in which they first explain that already the judge-rapporteur in the “Schrems II” case elaborated on the possibility of reliance on the GDPR Article 49 derogations; second, they stress that organizations must be aware of additional considerations in the context of derogations provided in various GDPR Recitals, and finally, they summarize how likely various derogations may be applicable as alternative ways of transferring personal data in particular scenarios.¹⁷⁷² If exemptions for certain processing activities become recognized, this could lead companies to abandon their current reluctance to rely on such derogations and, to some extent, amend their documented set of data transfer mechanisms. GDPR furthermore allows for other mechanics to justify international transfers, for example an approved Code of Conduct pursuant to GDPR Article 40 and an approved certification mechanism pursuant to GDPR Article 42,¹⁷⁷³ in each case together with binding and enforceable commitments of the controller or processor in the third country to apply appropriate safeguards including as regards data subjects' rights. The European Union Agency for Cyber-security ENISA offers a certification framework for products, processes, and services¹⁷⁷⁴ and the European Data Protection Board issued guidelines on certification as a tool for transfers in 2022.¹⁷⁷⁵ In addition, the European Commission completed a study on GDPR certification mechanisms pursuant to GDPR Art 42, 43¹⁷⁷⁶ in which more than one hundred certification schemes have been identified, but only two schemes were highlighted as potential candidates to provide formal certification: the first one is ISDP 10003 offered by ACCREDIA, a scheme that is in line with ISO 17065:2012 and “provides principles and lines of control for a complete compliance assessment of an organization's internal processes regarding protection of personal data with particular reference to proper risk management.”¹⁷⁷⁷ The second is the

“European Privacy Seal” offered by EuroPrise for products, services and websites.¹⁷⁷⁸ As for Codes of Conduct pursuant to GDPR Article 40, the EDPB adopted two Codes of Conduct for cloud providers,¹⁷⁷⁹ which certainly helps to demonstrate compliance but cannot be considered a formal (GDPR) certification. The same applies to various other certifications, for example ISO 27001 on information security management, ISO 27017, a complementary standard to ISO 27001 for cloud services, or ISO 27018 which is yet another complementary standard that contains guidelines applicable to cloud service providers that process personal data.¹⁷⁸⁰ However, developments with cloud providers should be closely monitored: the invalidation of the Privacy Shield led to additional compliance efforts in the framework of vendor screenings, and it is a positive signal that various stakeholders are working on an EU Cloud Code of Conduct¹⁷⁸¹ to propose a legal solution for the transfer of personal data outside the EU as an alternative to the annulled EU-U.S. Privacy Shield. Such a Code of Conduct must of course be approved by data protection authorities, but the Belgian regulator already expressed that they are “impressed by the efforts and resources dedicated by this industry-group to implement best practices for the cloud industry that are both hands-on and respectful of the data subjects.”¹⁷⁸²

7.2.4. Data trustee models

Further promising initiatives to help face challenges with (undesired) international transfer of personal data had been discontinued¹⁷⁸³, for example the data trustee model Microsoft offered together with the German Telekom¹⁷⁸⁴ with German data centers and a set up that would prevent that data are accessed by or shared with governmental agencies. In 2021, it was announced that the German Telekom will again provide a “Cloud Privacy Service for GDPR compliant use of Microsoft 365”.¹⁷⁸⁵ Data will be

encrypted, which obviously is a key measure when it comes to facilitating international data transfers: in August 2021, the Belgian Council of State said that encryption is a sufficient measure for U.S. data transfers.¹⁷⁸⁶ In this context, it is important to note that the issue of government access to personal information is neither novel nor unique to the USA. There are numerous laws that require companies to provide personal data to public authorities, e.g., for financial transactions or in the telecommunications sector. Moreover, in 2018, the European Union proposed¹⁷⁸⁷ an e-Evidence regulation¹⁷⁸⁸ that envisages that law enforcement and judicial authorities access electronic evidence for investigation purposes, and which faced criticism.¹⁷⁸⁹ Some authors claim that this proposal “continues with the disastrous development in dealing with digital platforms: the outsourcing of fundamental rights protection to providers”.¹⁷⁹⁰ The obligation for service providers to cooperate with law enforcement authorities¹⁷⁹¹ may be highly desirable from a legislator's point of view. But it must not be forgotten that private sector companies are neither responsible nor qualified for the protection of fundamental rights: How shall an average company¹⁷⁹² decide whether or not the EPOC¹⁷⁹³ cannot be executed because based on the sole information contained in the EPOC it is apparent that it manifestly violates the Charter of Fundamental Rights of the European Union or that it is manifestly abusive, the addressee shall also send the Form in

Annex III to the competent enforcement authority in the member state of the addressee.¹⁷⁹⁴ As a consequence, providers criticize both, the effort associated with the new instruments and the planned transfer of responsibility for checking the legality of the orders.¹⁷⁹⁵ The issue is of such importance that the OECD dealt with the topic and adopted¹⁷⁹⁶ the first intergovernmental agreement on common approaches to safeguarding privacy and other human rights and freedoms when accessing personal data for national security and law enforcement purposes, the “Declaration on Government Access to Personal Data held by Private Sector Entities.”¹⁷⁹⁷

7.2.5. Technical solutions

Various other options¹⁷⁹⁸ have been discussed at technical level to avoid (government) access to data including personal information, for example encryption or anonymization as well as data localization or the use of so-called private clouds or synthetic data – but they all come along with their own factual limitations, technical difficulties, or legal challenges: anonymization of data is difficult to achieve; many studies have shown that supposedly anonymous data can be re-identified¹⁷⁹⁹. Similar problems have been reported for so-called synthetic, i.e., artificially manufactured, data which are currently being discussed¹⁸⁰⁰ as a privacy-friendly solution, for example in the area of healthcare.¹⁸⁰¹ Encryption may not be appropriate for all datasets or may not work for all times due to technological progress,¹⁸⁰² and the future of such a protective measure is questionable as the EU is thinking about prohibiting

encryption¹⁸⁰³ to better fight online and / or cyber-crime. Apart from individuals' legitimate security interests, it must not be forgotten that secure communication is essential for a free press or professional secrecy, which makes the balancing of interests very hard. The use of private clouds sounds promising, but apart from access issues, private clouds could simply be less secure than public clouds: cloud service providers can spend much more on security tools than any large, but single enterprise could: the cost of security is diluted across millions of users to fractions of a cent.¹⁸⁰⁴

7.2.6. Adequacy decisions

Adequacy decisions are the most effective mechanism for international data transfers as organizations are not required to put in place any specific measures; consequently, some "third countries" started adapting their data protection laws to be more in line with the GDPR (for example, Brazil) in the hope to obtain the adequacy status one day.¹⁸⁰⁵ At present, only a handful of countries have been recognized as adequate by the European Commission.¹⁸⁰⁶ In this regard, the Republic of Korea was the latest addition,¹⁸⁰⁷ and conversations on EU-Japan mutual adequacy arrangements commenced.¹⁸⁰⁸ The problem with adequacy decisions is that the Commission adopts adequacy decisions at a slow pace because the European Commission is cautious and wants to ensure that adequacy decisions will prevail. In the framework of the European Parliament's annual review of data-transfer agreements, it was discussed whether California could have its own Privacy Shield arrangement separate from the rest of the U.S. given that California indeed introduced strong privacy rules.¹⁸⁰⁹ This is a truly interesting development, because many of the Big Tech players have their headquarters in California, and an arrangement with a sub-federal territory is indeed possible under GDPR, because adequacy status can be granted to regions as opposed to countries.¹⁸¹⁰ Such a development could once more reshape the

global landscape for data transfers. At present, it seems that a new adequacy decision for EU-US data transfers is finally underway,¹⁸¹¹ however, stakeholders like NYOB already raised their concerns, and announced their willingness to challenge the Commission's decision.¹⁸¹²

7.2.7. Data localization, data residency and data sovereignty

Local data storage has been discussed as an appropriate response to concerns in the framework of international data transfers and global data processing. In fact, many countries around the globe already have specific data localization requirements: some introduced rules for selected industries or certain providers such as social media companies¹⁸¹³ or for public service providers or for certain types of data like government data, telecommunications (metadata), health records, payment information or geo-data.¹⁸¹⁴ It can generally be said that various jurisdictions distinguish between data localization, data residency and data sovereignty¹⁸¹⁵: data residency refers to the geographic location of data storage for regulatory reasons, and data sovereignty is about data being hosted in a country to which the country's laws apply to ensure the country remains in control.¹⁸¹⁶ Additionally, many countries restrict transfer of information which they consider relevant for national security, for example information that is relevant for military technology.¹⁸¹⁷ However, recent developments show that local data storage might be even more difficult to achieve in the future: Microsoft is experimenting with underwater datacenters¹⁸¹⁸ and reports that they are 'reliable, practical and use energy sustainably'. The interesting question here would be which law(s) are applicable in such scenarios. Moreover, data localization and data residency is questionable from both, a data security and a data protection perspective: common reasons for such initiatives are the fight against espionage and crime, strengthening of cyber-security and the pursuit of

resilience. But technically speaking “physical access to a server or device containing data is neither a necessary nor a sufficient condition for access to information (...). On the other hand, logical access is both necessary, and may be sufficient to provide access to data in an intelligible form, regardless of geographic location”.¹⁸¹⁹ While no general statement can be made as to whether local data storage may raise security concerns since not all local data centers may have the same (state of the art) level of safety and security, such issues may still arise when using one (single i.e. vulnerable point of failure) location which some therefore describe as the Galapagos syndrome:¹⁸²⁰ a comfortable short-term solution that may lead to long-term extinction. The above examples of why national legislators came up with data localization and data sovereignty should not be seen in isolation: reverse and / or social engineering may also result in loss of know-how from a company and data breach from an individual’s perspective; in this regard, data localization cannot help. In many countries, an important factor to foster data localization is to help law enforcement and national security agencies’ access to data – but (foreign) government access to personal information was the reason why European Court of Justice dealt with the issue of international data transfers in the framework of their EU-U.S. Privacy Shield decision. Data localization is justified by the need to protect personal information, but the above circumstances explain why there is also fear that (domestic) government access to data through data localization undermines data privacy, and that is why some claim that data localization does not solve the problem of surveillance, but introduces new troubles of its own¹⁸²¹, including negative political impacts “by bringing information under governmental control”.¹⁸²² From a data privacy perspective, it should be taken into consideration that general data protection principles like data minimization, data integrity and confidentiality may not be met if companies must establish and defend multiple versions of its systems across continents with additional hardware, additional vendors and additional staff. Data localization and data residency are complicated and costly and may lead to further fragmentation. Apart from the fact that GDPR’s official title explains that the regulation also is about the “free movement of data”, the EU commission previously discussed to ban forced data localization,¹⁸²³ and it shall be noted that requirements to keep data in Europe would likely violate WTO rules and other global agreements.¹⁸²⁴

7.3. Emerging U.S. legal landscape

U.S. legislators have been very active in recent years when it comes to regulating privacy and AI: California seems to be leading in the area of data protection as the state worked on several major initiatives: the California Consumer Privacy Act (CCPA),¹⁸²⁵ and the California Privacy Rights Act (CPRA)¹⁸²⁶ are important initiatives in this context, and the Online Privacy Protection Act (CalOPPA)¹⁸²⁷ was the first state law in the nation to require commercial websites and online services to post a privacy policy; it went into effect already in 2004 and was amended in 2013 to require new privacy disclosures regarding tracking of online visits.¹⁸²⁸ In addition, California introduced a chatbot law in 2022 that prohibits the use of undeclared bots to better identify machine generated content,¹⁸²⁹ and California's Privacy Protection Agency which was created under CPRA held its first meeting and is prepared for upcoming rulemaking.¹⁸³⁰ The U.S. privacy landscape became so dynamic that law firms started to provide weekly status information about the status of state privacy legislation.¹⁸³¹ Several states introduced their own privacy bills with requirements that are somewhat similar to those set forth in the GDPR, for example Washington¹⁸³² which grants consumers various rights such as access, portability, correction, deletion, and the right to object to the processing of their data in certain circumstances, or Virginia: the law requires opt-out for targeted advertising and profiling decisions that produce legal or similarly significant effects and mandatory data protection impact assessment for certain activities including profiling.¹⁸³³ Colorado¹⁸³⁴ also enacted privacy legislation that has special

protections for sensitive data and adopted certain privacy-by-design principles,¹⁸³⁵ and New Jersey introduced a notable bill that reminds of GDPR by providing for a right for a consumer not to be subject to a decision based on solely automated decision making.¹⁸³⁶ Numerous other laws establish business obligations and consumer rights related to privacy with provisions about transparency and consent as well as data subject rights or the designation of Privacy Officers,¹⁸³⁷ for example, the Information Transparency & Personal Data Control Act,¹⁸³⁸ the Deceptive Experiences to Online Users Reduction Act,¹⁸³⁹ the Banning Surveillance Advertising Act,¹⁸⁴⁰ the Social Media Privacy Protection and Consumer Rights Act,¹⁸⁴¹ or the Balancing the Rights of Web Surfers equally and responsibly Act.¹⁸⁴² However, just like the American Data Privacy and Protection Act (ADPPA),¹⁸⁴³ a proposed federal consumer privacy bill that, if enacted into law, would have regulated how organizations keep and use consumer data, most of these laws are addressed to consumers, meaning that either definitions are different or that the scope of these laws is different in comparison to GDPR or any other data protection laws that are concerned with the individual behind the data. This shows that historically, data protection – or more appropriately: privacy – in the U.S. was about consumer protection and vice versa, whereas in continental Europe, data protection initiatives were addressed to the public sector. While the emergence of privacy laws in the U.S. is generally welcomed, some describe recent developments as a “disparate landscape in need of consolidation.”¹⁸⁴⁴ Apart from basic privacy legislation, there is consensus about the need for AI-specific rules.¹⁸⁴⁵ Consequently, the White House dealt with the issue and provided guidance for the Regulation of AI applications¹⁸⁴⁶ which on the one hand, aims at promoting the development of trustworthy AI and encouraging public engagement, but on the other

the Future of AI Act,¹⁸⁵⁹ the Advancing American AI Act,¹⁸⁶⁰ the Advancing AI Research Act,¹⁸⁶¹ or the Mind Your Own Business Act.¹⁸⁶² And there is further legislation aimed at addressing risks in the development and use of AI systems, in particular risks related to algorithmic bias and discrimination: the Digital Platform Commission Act of 2022 has been introduced which would empower a new federal agency, the Federal Digital Platform Commission, to develop regulations for online platforms that facilitate interactions between consumers, as well as between consumers and entities offering goods and services to ensure that algorithms “are fair, transparent, and without harmful, abusive, anticompetitive, or deceptive bias.”¹⁸⁶³

8. Summary and conclusions

The Thesis dealt with the examination of the existing legal framework for Big Data and Artificial Intelligence from a data protection perspective and formulated the following three hypotheses: the failure of privacy self-management, the need for further development of the transparency principle, and the necessity for new controls. To explore the legal framework for Big Data and AI, the Thesis started with an introduction to the history of privacy, the development of data protection laws and the advent of Big Data, automated decision-making and AI. It provided an overview over the characteristics, types, and benefits of Big Data and AI and examined various risks of AI. The Thesis furthermore explored on legal definitions within existing sources of law with a focus on GDPR as a role model law. The Thesis concluded with a digest on relevant legislative initiatives as well as guidance and recommendations for the future regulation of AI and algorithmic systems. The examination of the historical context showed that it is important to distinguish various terms which are used interchangeably, namely, privacy and data protection. The debate is highly valuable to understand what is protected by data protection and data privacy laws and to determine whether present definitions are future-proof. The fact that privacy and the respect for the private life are mentioned in a variety of international conventions also demonstrated that privacy is considered a fundamental right. As such, protective mechanisms have traditionally been directed against the state, and this was reflected in first-generation data protection

laws. The Internet (of things), the growing digitalization, new technologies and new phenomena like social media platforms, together with the growing connectivity of devices, and the overall exponential growth of user, sensor, behavioral, etc. data lead to a well-known problem, the fact that the development of (appropriate) laws takes time. In this context, “cookies” are a good example: while debates are still focused on cookies, there is in fact already new technology which can do without cookies and provide for the same or at least very similar results. Another problem is that there seems to be a shift of protections of fundamental rights to the private sector: some argue that, because GDPR allows for processing based on legitimate interests as well as compatible processing and secondary use of personal information, this may lead to infinite processing or result in a self-regulatory regime. In this regard, the market power of certain companies within the so-called Industry 4.0 has to be taken into consideration: one author’s situational analysis is that “Alphabet controls our search and much of our mobile experience, Apple controls the remainder of our mobile and much of our content experience, Amazon controls a large portion of our content experience and much of the Internet of Things, and Microsoft essentially sweeps up everything else.”¹⁸⁶⁴ As a result, a small number of companies may have the power to control a large part of our personal information, perhaps rather based on corporate terms and conditions and less on privacy laws, and the phenomenon became so significant that it has put the antitrust authorities on notice.

As regards definitions, these are very significant since the scope and application of laws depend on clarity with regards to the interpretation of relevant definitions, and there are indeed challenges with definitions due to inconsistent terminology in various regulations and inconsistent use of terms within provisions, translation issues, and the introduction of new terms in new relevant laws like the draft AI regulation. It shall be noted that Big Tech players who process personal information at large scale define types of data in a way that is unknown to data protection laws. In their data processing agreements, they distinguish between data entered by users and data generated by systems or otherwise accessed, which shows that there is awareness about the de-facto predominance of indirect data collection. This shows the need for consistent and future-proof definitions. Given the fact that the GDPR has a broad definition of personal data, some speak of the GDPR as the law of everything¹⁸⁶⁵ because literally all processing seems covered as everything may be regarded as personal data. Moreover, anonymization is technically hard to achieve or cannot be applied to certain data sets where real data is needed as opposed to synthetic or dummy data. Consequently, data protection laws may indeed govern most of what happens with (customer, employee) data within a business.

Regarding the benefits, characteristics, and use cases of Big Data and AI, the Thesis explained that the exponential growth of (user, behavioral, sensor) data, the progression of computer science in recent years together with an enhanced infrastructure up to Quantum Computing and thus better speed of processing was a prerequisite for all the Big Data Vs (such as volume, variety, velocity, veracity, variability, volatility, value). It has led to the emergence of an impressive number of AI applications, ranging from Natural Language Processing, Robotics, Computer Sensing and Vision, Machine Learning and Deep Learning, Knowledge Engineering or Neural Networks to name some. While companies welcome the business intelligence that Big Data and Ai made possible by offering real-time insights, analytics, and forecasting, depending on the design and use of underlying algorithms, AI applications may collide with basic privacy principles and may have the potential for threat and harm. That is why this technology had to be evaluated from a risk perspective: the examination of AI risks showed that a common effect of algorithmic processing or automated decision-making and profiling in the context of Big Data, ADM and AI is the secondary use of personal information. Compatible re-use of personal data is admissible to the extent the conditions of GDPR Article 6 (4) are met, i.e. considering the nature of the data in question, the context in which the data were collected, the relationship between the purposes for which the data have been collected and the purposes of further processing, the impact of the envisaged data processing on the data subjects, and the safeguards applied by the controller. Since a major characteristic of many AI applications is a certain degree of autonomy with systems being able to perform in an unsupervised manner, it is questionable whether such data processing operations meet all these requirements or if that may lead to indefinite re-use of personal data which could also render purpose and storage limitation obsolete. Furthermore, data aggregation and data maximization go hand in hand with most Big Data and AI applications, simply because large (training) datasets are needed for most use cases. Big Data is about turning volume to value, but that may conflict with GDPR's principle of data minimization, and it may pose a threat to individuals insofar as there is a risk of (re-) identification: the more datasets grow, and the more data is attributed to a person, the easier it gets to identify the person behind the dataset, and various studies confirmed that actually not much information is needed to uniquely re-identify individuals. The usual practice of constant enrichment of datasets further adds to the risk of identification and profiling: if one and the same person is constantly analyzed and scored this may result in detailed profiles and (online) identities the person is not aware of. Another problem of Big Data and AI applications is that, quite often, external (collateral) data are processed; the upload of address books to social media platforms is a simple example of this risk: whenever a user uploads his individual contacts to a social media platform, the platform receives a full set of contact information of other individuals, and these individuals may not have been informed nor did they consent to such data collection. Further potential risks of AI applications are opaqueness and lack of human oversight. A challenge with Artificial Intelligence is that quite often, important factors are unknown, e.g., details of the processing operations, and the true operators behind those algorithms in the sense of who exactly is responsible for which part of the processing. In many cases, input and output are known,

but the workings in between are not, which is also known as the black box effect. The ability of AI to act autonomously and in unforeseeable ways adds to the fear that certain types of AI systems may be considered a Kafkaesque system of unreviewable decision-makers,¹⁸⁶⁶ and that explains why human oversight may be at risk when algorithms are used for the processing of personal information. Closely connected to the issue of oversight are question of responsibility and liability. While accountability is established as a privacy principle and rated as an important value in literally all publications, fewer texts deal with the fact that AI has the potential to challenge the traditional notions of legal responsibility (and legal personality). In this regard, the European Parliament and the European Commission provided various publications, for example on liability issues in respect of autonomous robots, liability (and safety) implications of Artificial Intelligence and the Internet of Things, or a report on liability for other emerging technologies. In their papers, the EC and EP explain their key findings with regards to new duties of care, strict and vicarious liability, the burden of proof as well as insurance issues. From an individual's perspective, the question would probably primarily be whom to turn to: a court or a regulator or a company, and if so, which one: from a GDPR perspective, there are controllers, processors and joint controllers, but the problem is that and more laws introduce more players: e.g., the DGA, and looking at the categorization of relevant players within the draft AI regulation, the situation becomes even more complex as there are providers, manufacturers, distributors, importers – how should an average person without corresponding expertise be able to tell who is responsible for which part and under which conditions. Big Data and AI applications in many cases raise further concerns, which is a situation literature describes as the information mismatch. Companies must be transparent about the processing of personal data, but even GDPR itself sets limits to transparency obligations: Article 13 (2) lit. f limits the obligation to information about “the existence of automated decision-making, including profiling, referred to in Article 22 (1) and (4) and, at least in those cases, meaningful information about the logic involved, as well as the significance and the envisaged consequences of such processing for the data subject”. Details about the significance as well as envisaged consequences of the processing are relative insofar as dynamic processing may simply not allow to foresee all relevant consequences; details about the underlying logic are relative insofar as meaningful information is simply not the same as comprehensibility or reproducibility of decisions. Companies may moreover argue with trade and businesses secrets to avoid having to disclose underlying algorithms they use. Another factor that adds to the mismatch is the dilemma of information asymmetry between users and (Internet, online) service providers, and the situation is worsened by the fact that users in many cases are not aware that seemingly free services may not really come without a service in return, which explains the famous quote that, “if you are not paying for a service, you are the product.”¹⁸⁶⁷ The problem is that individuals unlike

¹⁸⁶⁶ Daniel Solove uses the term in his book: *The digital person: technology and privacy in the information age*. New York University Press 2004.

¹⁸⁶⁷ Ben Kepes: *Google users - You're the product, not the customer*. Article published December 4 2013, available at <https://www.forbes.com/sites/benkepes/2013/12/04/google-users-youre-the-product-not-the-customer/#:~:text=The%20old%20adage%20goes%20that%20if%20you%27re%20not,up%20advertising%20to%20users%20of%20these%20free%20products>.

companies do not dispose of enough information to defend themselves “against being sorted in the wrong bucket”.¹⁸⁶⁸ Further risks that have been discussed in the context of Artificial Intelligence are the potential for discrimination for surveillance. The probabilistic nature of individual decision-making and profiling is highly desired from a business perspective, but their inherent opacity together with their potential for discrimination and discrimination is problematic from an individual’s perspective, and that is why many believe that these two risks are probably the most important dangers from the point of view of those affected. The consequences of such risks are far-reaching. Employers may turn down job candidates based on social media information without providing candidates with an opportunity to comment on their findings, and this explains the problem of information injustice and information inequality. Some object to the use of AI applications in field of welfare, public administration, and jurisprudence as this may either pave the way or strengthen existing injustices or even restrict the legal process, and consequently, limit access to justice. Demonstrable bias in recidivism scoring systems or bias in healthcare are quite dramatic examples, and they show that AI risks affect individuals and society. The case of Cambridge Analytica demonstrated that the use of AI has a political dimension as well. Influencing voters is traditionally at the core of any campaign, but the problem is that there is little transparency and awareness of how sophisticated this technology is and how cleverly it can be used: AI could be used to create targeted propaganda or to manipulate photos (for morphing purposes) and videos (for Deep Fakes) and this way, pose a threat to democracy.

The above circumstances underline the challenges with the traditional concepts of privacy self-management and transparency: even if lack of transparency is not the problem, transparency as such is problematic since the ineffectiveness of transparency requirements seems to be proven by now. People are as badly informed as they are overtaxed with long and complex privacy notices; people routinely turn over their data for small benefits; people care much more about price-sensitive information than about data protection information; people are much more concerned about social privacy than about institutional privacy, and if people are about to decide about their privacy preferences, they tend to make their lives easy and accept all default settings instead of taking their time to really decide on relevant settings. Even worse, certain Apps take advantage of psychological (behavioral) patterns that can reinforce loss of user control, and legislation on such dark patterns is just in the process of being created. Some authors describe the afore-mentioned challenges around information obligations as the transparency paradox, which is connected to the control paradox, i.e., the problem that affording more control to users does not help them to better protect their privacy. It seems that the opposite is true, affording more control to users does not necessarily lead to a better protection of their data – this may even induce them to reveal more information. If people feel that they have control over their data, they

¹⁸⁶⁸ Omer Tene: Privacy: For the rich or for the poor? Concurring Opinions. Article published July 26 2012, available at <http://www.concurringopinions.com/archives/2012/07/privacy-for-the-rich-or-for-the-poor.html>. Retrieved October 23, 2021.

tend to provide more data about themselves. Related observations are known from other fields, for example in the framework of the introduction of the safety belt legislation as people felt more secure with safety belts and drove less carefully. The control paradox is connected to another problem, the security paradox. Security measures such as access controls are principally indispensable. But any such measures require the processing of personal data such as log-in data, and the general risk is that the more data are processed, the larger the risks that data are somehow compromised. Moreover, users are often required to provide a fingerprint in the framework of the authentication process, and that may lead to further risks. The problem is that, unlike a password, there is no reset process for a unique fingerprint, and what is worse, such data can be manipulated very easily, because access to a used object is sufficient to reproduce a fingerprint, and if fingerprints are a mandatory part of official ID-documents, then the individual concerned has a serious problem. Another effect which is connected to the security paradox can be described as the trust paradox. A growing number of people are so used to relying on all kinds of Apps as their single source of truth that there does not seem to be any more room left for own decision making, and that has an impact on how they handle their data. Similar findings were made in the framework of the introduction of COVID apps. The mere fact that technology can track cases of infections does not replace other necessary measures to prevent infections. Therefore, one of the most important observations is that privacy self-management seems to have failed in practice, because the exercise of privacy self-management does not seem to afford the needed protections.

To evaluate whether traditional concepts are still viable, the existing legal framework had to be examined. Consequently, a substantial part of the Thesis is dedicated to the analysis of relevant sources of law to provide an overview over the existing legal framework for processing of personal data and the protection of individuals' rights. At international level, the Universal Declaration of Human Rights, the European Convention on Human Rights, the Charter of Fundamental Rights of the European Union, Convention 108+, OECD's Privacy Guidelines as well as further conventions and resolutions underline the human rights dimension of data protection issues. Regarding superior law, it is often overlooked that legally binding global trade agreements play a role in the context of data processing as well since they address trans-border data flows. These agreements set forth certain standards, including norms of non-discrimination that require protections against unjustified data localization requirements. From a data protection perspective, many immediately think of the General Data Protection Regulation as a major piece of legislation and because the GDPR was a milestone in the history of data protection laws and a role model law for many other countries, however, it is not the only relevant regulation. At EU-level only, a variety of other regulations and directives must be taken into consideration when processing of (personal) data, automated decision-making, profiling, Big Data or Artificial Intelligence are in question – be it from a security, database, know-how protection, compliance equal opportunity, or product safety perspective. In terms of existing rules and regulations, it is important to take note of the fact that already at present, various sector or industry specific (e.g. banking: high frequency algorithmic trading), or

product specific (e.g. medical devices) as well as purpose (e.g. facial recognition, autonomous driving, autonomous weapons) and data specific (e.g. biometric data, genetic data, health information) laws exist which must be obeyed when Big Data applications and algorithmic systems are used. This is especially true when one has a look at the legal framework in the U.S.A. A federal privacy law is being discussed, and several states either already introduced or are working on laws that specifically deal with algorithm-based data processing and automated decision-making. The U.S.A. are a special case insofar as any legislative attempts de facto have a global impact since all Big Tech players have their headquarters in the U.S.A. – more concretely: California, which can be considered a pioneer of data privacy laws within the U.S. because California more than just one law dealing with data privacy, and the interesting thing is that adequacy status can not only be granted to countries.¹⁸⁶⁹ In recent years, many countries around the globe introduced their own privacy bills with requirements that are similar to those set forth in the GDPR and which grant consumers various rights such as access, portability, correction, deletion, and the right to object to the processing of their data in certain circumstances; other laws requires opt-out for targeted advertising and profiling decisions that produce legal or similarly significant effects and foresee that mandatory data protection impact assessment must be carried out for certain processing activities including profiling. Documentation requirements and data subject rights often sound familiar; however, the scope is not the same as some laws are rather concerned with consumers than individuals, and conditions for the exercise of data subject rights may vary as well. It can therefore be said that the codification and regulation of systems and applications that use Artificial Intelligence is not in their infancy as there is already a variety of laws that govern the use of AI. The same is true for technical standards, more and more standards are being developed to help with the design and implementation of AI applications. This is not surprising since such technology is already being used across the board, for example, in production (robotics), operations (forecasting), marketing (analytics), finance (scoring), healthcare (diagnostics), in smart cities, smart homes, and smart devices and as well as for (behavioral, online, location) tracking and targeting purposes. In addition, there are numerous national data protection laws and laws with specific provisions pertaining to the processing of personal data, even within the European Union as the General Data Protection Regulation has dozens of opening clauses that either provide or allow for national rules for certain areas (e.g., processing of personal data in the employment context, see GDPR Art. 88) or for certain types of data (e.g., processing of national identification numbers). Depending on the use case in question, further laws may be applicable such as consumer protection and e-commerce or competition laws for marketing activities or labor, equal opportunity and industrial constitution laws in the employment context. The same is true for products or connected devices with a particular focus on information and cyber-security provisions and rules that

¹⁸⁶⁹ Jennifer Baker: California Dreamin’: Is a single state EU data protection deal on the cards? The article refers to a statement by Bruno Gencairelli who heads the international data flows and protection unit at the European Commission (DG Justice and Consumers). Article published January 20 2020, available at <https://www.cpomagazine.com/data-protection/california-dreamin-is-a-single-state-eu-data-protection-deal-on-the-cards/>. Retrieved October 22, 2021.

apply to the Internet of Things. It can generally be said that data protection laws are on the rise, the legal landscape became very dynamic with numerous data privacy and data security (breach provision) laws as well as specific provisions on the use of sensitive data like biometric or genetic information. Moreover, it should be considered that, for example, Brazil's LGPD has a territorial scope that extends outside of Brazil,¹⁸⁷⁰ meaning that as a result, global companies to which these laws apply must comply with a multitude of laws. This may lead to the so-called Brussels-effect which guides the way companies are doing business, because multinational organizations adjust their global operations to EU standards to be compliant. Therefore, the existing legal framework is characterized by rising complexity – and opposing legislative aspirations. A technical example is encryption which is desirable from a data protection perspective but at the same time, may be legally prohibited for reasons of crime prevention. This is both, a legislative and a provider trend as recent discussions around certain provider's filter functions show. A legal example is data localization as many countries have introduced data localization requirements, either for selected industries or for public service providers or for certain types of data (for example, government data, health records, or payment information). Another factor to consider is the different approach various legislators take. The European approach is rights-based, the U.S.A. is harm-based, and China pursues a control-based approach, and different jurisdictions focus on different things, for example the U.S. legal landscape is mostly concerned with customers, not all kinds of individuals, and often excluding employees. Probably the greatest difference between the U.S. and the EU approach to data protection is that European law is permission-based, meaning that a legal basis is always required for the processing of personal data, whereas in the US, the contrary is true, because data can generally be processed unless a law explicitly prohibits such an activity. But considering how difficult the exercise of individual rights and privacy-self management in today's Big Tech David vs. Goliath data processing environment is, a harm-based approach may be more of a future-proof concept.

As regards the GDPR, the envisaged harmonization of data protection laws was not achieved, not even within the EU. Differences in the interpretation as to the scope of data privacy laws and in particular data subject rights resulted in data protection being far less uniform than generally assumed. With regards to the question whether GDPR addresses processing with the help of Big Data, ADM, and AI, GDPR's fundamental principles, its permission- and risk-based approach together with a dedicated set of individual rights form a sound foundation for data protection. The General Data Protection Regulation focuses on principles such as lawfulness, fairness, and transparency, data minimization and accuracy, purpose, and storage limitation; existing controller and processor duties include accountability and joint liability, and obligatory vendor contracts and screenings. Documentation and evaluation requirements range from records of processing activities to impact assessments and notices; mandatory consultations

¹⁸⁷⁰ Caitlin Fennessy: Top five operational impacts of Brazil's LGPD. Part 3: international transfers. Article published November 5 2020, available at <https://iapp.org/news/a/top-5-operational-impacts-of-brazils-lgpd-part-3-international-transfers/>. Retrieved October 17, 2021.

with data protection supervisory authorities whenever impact assessment indicates that the processing would result in a high risk are also foreseen by law (GDPR Art. 36), and supervisory authorities do not only have the competency to issue fines, they may also impose a temporary or definitive limitation including a ban on processing (GDPR Art. 58 II lit. f). From a data security standpoint, technical and organizational measures, anonymization and pseudonymization, or certifications are required by law, and further measures like codes of conduct are conceivable to achieve an appropriate level of data protection. Therefore, the GDPR does provide a variety of means to deal with (high-risk) processing of personal information. The GDPR is also not silent on various topics that are highly relevant for Big Data, ADM, and AI, for example, consent, profiling, automated decision-making, data subject rights, admissible re-use of personal information, international data transfers, transparency, data security or special categories of personal information. Moreover, GDPR has numerous ambiguities. While data subject rights are strengthened, legitimate interests are an acknowledged legal basis, and compatible processing is admissible under the conditions set forth in GDPR Art 6 IV, which is why some fear this may lead to unlimited processing. There is also controversy about whether profiling under GDPR Art 22 shall be interpreted as a prohibition or a data subject right, and there is not much (consistent) case law to explain GDPR Art 21, the right to object, on grounds relating to his or her particular situation. The fact that the standard of GDPR Art. 22 is only applicable if the decision is based solely on automated processing, including profiling, which produces legal effects concerning him or her or similarly significantly affects him or her sounds like a guarantee, but it also shows that there is a limit to this right, because fully automated means that there is no human intervention at all, which could be circumvented by implementing spot checks. It is also not always clear what has the quality of a decision (or similar legal effect): does that only apply to a final (job candidate selection, loan, or housing application, etc.) decision or should this rather be regarded as a constant criterion for the design of Big Data and AI applications, and thus be applicable to every relevant processing phase? GDPR is perhaps not as far-reaching or future-proof in terms of data subject rights, and GDPR enforcement seems to be a challenge as well. While we have seen several multi-million dollars fines, there has also been a series of fine failures with drastic reductions of penalties of up to 90 % which showed that imposing administrative fines under GDPR might not be easy, because administrative, procedural as well as commercial criminal laws must be taken into consideration as well. With respect to individual rights, GDPR indeed introduced new rights such as the right to data portability, however, some argue that the right to be forgotten or the right to restriction of processing shall be enhanced by adding a right to have data replaced as this may help with preventing identification, and a right to participation and human intervention as that may be useful with the needed social debate at societal and to avoid undesired results at individual level. Moreover, some U.S. laws introduced “Do Not Sell” as an individual right, and that may be more efficient than GDPR’s transparency, information and onwards notification obligation. This

approach underlines the awareness for the value of data, the importance of data sovereignty and the significance of today's data-driven businesses which some describe as surveillance capitalism.¹⁸⁷¹

With respect to a possible (future) framework for Big Data and AI, numerous guidelines and recommendations have been issued by public bodies and private sector initiatives as a reaction to the emergence of Big Data and AI as an economic and societal given. At international level, OECD's AI principles as well as the G20, G7 and World Economic Forum recommendations on AI are noteworthy initiatives, ditto for various declarations that have been provided by the United Nations, for example, by UNESCO, UNICRI, UNICEF or UN's Special Rapporteur on the Promotion and Protection of the Right to Freedom of Opinion and Expression. As for guidance and recommendations at European level, the European Commission was very active by issuing a White Paper on Artificial Intelligence, an Ethical Charter on the Use of AI in Judicial Systems, or the Resolution on Civil Law Rules on Robotics. The Council of Europe also issued recommendations as well as ethics guidelines for trustworthy AI, which is a good example of the fact that the most of these initiatives focus on AI ethics. The same is true for various expert guidelines, civil society and multistakeholder recommendations such as the Toronto and the Montreal Declaration or papers published by the Future of Life Institute and the Centre for Information Policy Leadership. There is also considerable intergovernmental cooperation with regards to Artificial Intelligence, e.g., OECD's Network of Experts on AI, UNESCO's Ad Hoc Expert Group, EU's High-level Expert Group on Artificial Intelligence, or the Global Partnership on AI. As regards to expert / multistakeholder / NGO guidelines, it can be said that these initiatives have in common that they intend to provide useful recommendations for the use of Artificial Intelligence, however, they vary insofar that some guidelines focus on the ethics and responsible use of AI including the future of work, whereas other recommendations are concerned with the classification of AI systems. Most of these papers underline the importance of awareness raising and emphasize the relevance of a human-centered approach to AI and the need for the protection of privacy and intimacy, as well as human control and oversight. Notwithstanding their differences, these initiatives show certain parallels, and a common feature of many international, intergovernmental, multistakeholder, civil society initiatives and expert guidelines is that they stress the relevance, application, and enforcement of existing principles like fairness, accountability, transparency, purpose specification, collection and use limitation data quality, accuracy, Privacy by Design and by Default, and technical and organizational measures. An analysis of propositions relating to AI applications shows that many proposals suggest that any future AI regulations or AI principles shall also take privacy, responsibility, non-discrimination as well as human control of technology and the promotion of human values into consideration.¹⁸⁷² Some of these initiatives also

¹⁸⁷¹ Shoshanna Zuboff: *The age of surveillance capitalism – the fight for human future at the new frontier of power*. Profile Books, 2019.

Berkman Klein Center Research Publication no. 2020-1 published February 14 2020, available at https://papers.ssrn.com/sol3/papers.cfm?abstract_id=3518482. Retrieved October 17, 2021.

address judicial and societal implications of AI applications and examine how to best ensure fair trial and access to justice and welfare how to best protect the freedom of expression, assembly and association, and the right to work in an era of growing automatization and digitalization. Other initiatives elaborated on the question how privacy bills should (not) be written, and they question the concept of rights-based governance where individual rights function as the primary mechanism for governing the collection and processing of personal data since that puts the burden of privacy controls on the individual rather than the controller as such a conventional approach might not be appropriate in the AI era. To that end, some papers propose the strict prohibition of certain AI uses, for example secret profiling and unitary scoring, or facial recognition. Others stress that existing legal framework shall be exploited, for example, by focusing on the principle of accountability. But the question is whether accountability as set forth in existing data privacy laws goes far enough to guarantee responsibility, liability, contestability, safety, and fairness together with an approach to data processing that includes sound risk assessment and human oversight and human intervention if need be. One problem with the application of existing legal principles of data protection is that, even if privacy principles are applied, there is a risk of trade-offs between different data protection principles. Such tensions may arise between the principles of accuracy, fairness and privacy, for example, more data may lead to more accuracy, but at the expense of individual's privacy; if AI is tailored to avoid discrimination, i.e., if certain indicators are removed to that AI is fair, this may have an impact on accuracy; if AI is tested to see if it may be discriminatory, it needs to be tested by using data that is labeled by protected characteristics, but that may be restricted under privacy laws that govern the processing of special category data. The concepts of privacy self-management and transparency are closely connected, and if privacy self-management as a rights-based concept no longer fits the era of AI because it does not seem to afford the needed protections, then the concept of transparency needs to be changed as well given the information mismatch and the inconsistency between peoples' opinions on the relevance of privacy and their actual behavior which tells a different story. Transparency could be further developed by moving away from lengthy one-time notices that address individuals in processing scenarios and which are written by lawyers for lawyers in the direction of comprehensive and meaningful (ad hoc and repetitive, see GDPR Art. 13 III) information including making true operators known: various service providers may be involved in processing operations, but this is not what the average app user gets to know. Publicity could be added on top of transparency, meaning that not only individuals need to be informed, but a wider audience, for example, by establishing public registries allowing any interested party to access relevant information such as details on risk evaluations, mitigation measures and information on sub-processors, and general labeling obligations when humans interact with AI irrespective of legal or other significant effects, and if the AI application makes decisions: mandatory information about the legal and factual scope of the decision, as well as explainability and replicability of decisions. Ideas like mandatory labelling of AI applications and failure transparency, i.e., the obligation to inform the public about mis-developments and errors as well as public registries for (audited) AI apps that establish improved access to information

that is not limited to one's own personal information, could help establish a new kind of transparency that exceeds existing standards, moving in the direction of general publicity instead of individual information. This may increase the chances for the needed social debate for this important technology that has the potential to shape our lives, and it could also allow to better exercise individual's rights and foster individual engagement, which is a factor that should not be underestimated as a single data subject's activity has repeatedly brought down an entire framework for international data transfers. The success of such initiatives can be compared to the functioning of the fourth pillar of the state which, in addition to the executive, legislative and judicial branches, can influence developments through reporting and public discussion. And public debate is an important instrument as it allows for better insight into how algorithmic apps can be used like the case on leaks on Meta's practices such as design decisions that may influence the spread of misinformation or have a negative impact on users' mental health¹⁸⁷³ has proven. From an individual's perspective, some underline the need for the establishment of new data subject rights such as the right to participation or the right to human intervention or examine the idea of having personal information replaced rather than having the processing restricted, because that might be a more effective way to avoid re-identification and help with non-linkability. They moreover demand enhanced redress mechanisms and broaden the right of action for consumer protection and competition authorities or advocate to foster the use of anonymized and synthetic data whenever possible. There are also debates about data ownership to fight data monetization, but it is questionable how that may work in practice, however, contractual limitations of the use of personal data are not unimaginable given that service-for-data is a well-established business model, but at present, it is strictly unilateral. Given AI's capability for surveillance and its potential impact on human rights and democracy, some recommendations dealt with new requirements such as mandatory human rights impact assessments and termination obligations in the event a system gets out of control. Others recommend the introduction of further principles such as non-discrimination and inclusion, equality and diversity that should be applied whenever algorithmic processing is in question. Some of the guidelines emphasize the need for a new kind of accountability which shall include "all players" in the data value chain; GDPR sets forth controller and processor responsibilities, but it does not necessarily address manufacturers: the law is concerned with the processing of data, not products. Digital workforce aspects show that there is an important intersection between individuals rights and societal values, and some therefore claim that new controls shall also include new values which are not only judged from an individual's perspective but consider the societal perspective and include public safety obligations. The mass application of Big Data, AI and automated decision-making not only affects individuals, but society so that many initiatives focused on a human-centric approach that serves society and explored on embedding ethics into Big Data, ADM, and AI, and. But embedding ethics may be problematic as

¹⁸⁷³ Ryan Browne: Facebook whistleblower behind major leak is going to testify in Europe. Article published October 12 2021, available at <https://www.cnbc.com/2021/10/12/facebook-whistleblower-behind-major-leak-is-going-to-testify-in-europe.html>. Retrieved January 22 2022.

the interpretation of ethical standards may vary; what might not be acceptable to some, may be acceptable to others, and this approach was also criticized as some consider that ethics may be an escape from regulation.¹⁸⁷⁴ It is comprehensible that industry may prefer a deregulated landscape for novel technology claiming that regulation stifles innovation, but self-regulation has not proven to work,¹⁸⁷⁵ and therefore, many voices explore on new algorithmic accountability codes instead of voluntary codes of conduct, and call for the establishment of mandatory auditing and monitoring of AI systems. Ditto for standardization of testing procedures, because poor data quality and errors in the design of AI apps may lead to bias and discrimination. Many also recommended the formation of specialist independent oversight bodies with simplified coherence mechanisms, including the right to issue orders against any processor or manufacturer to capture all players, and many initiatives insist on the prohibitions of certain AI applications, for example, for secret profiling, or the right not to be subject to a discriminatory decision, which shall be interpreted as an interdiction. AI can be used in novel ways, for example, by exploiting human vulnerabilities (e.g., by using speech synthesis for impersonation), by utilizing existing software vulnerabilities (e.g., through automated hacking) or the vulnerabilities of AI systems (e.g., through data poisoning or by introducing training data that causes a learning system to make mistakes or by inputs designed to be misclassified by Machine Learning systems). The potential for malicious use is one thing, AI's dual use character another: already today, AI is incorporated in "slaughter-bots," and that is why the United Nations discussed a ban¹⁸⁷⁶ on such technology; algorithmic errors in this context do not cause IT bugs that need fixing, but could lead to humans being killed,¹⁸⁷⁷ and the fact that the European Parliament,¹⁸⁷⁸ the Commission,¹⁸⁷⁹ and the Council¹⁸⁸⁰ address this gives

cause to hope. It is incomprehensible why this technology should be treated in a different manner than other technology for which imminent high risks have been identified; nuclear power, drugs or weapons and autonomous vehicles are typical examples where nobody would seriously argue against the need for a legal framework that addresses these risks. An important conclusion therefore is that new controls are needed, including a specific liability regime in accordance with product liability regulations which should cover all involved providers. Further recommendations for the future regulation of AI stress the importance of technical standardization or certifications, the need for external control mechanisms including the establishment of specific AI supervisory bodies or compulsory public archives and the introduction of termination obligations. There is a need for clear statements on and limits of certain use cases such as social scoring to rate citizens' behavior, because such uses of Big Data and AI may have an impact on fundamental rights such as freedom of expression,¹⁸⁸¹ freedom of assembly and association,¹⁸⁸² liberty, security¹⁸⁸³ and fair trial,¹⁸⁸⁴ physical, psychological, and moral integrity,¹⁸⁸⁵ as well as prohibition of discrimination.¹⁸⁸⁶ In this context, the proposals for the AI Act and for AI liability immediately attracted a lot of attention and received numerous comments: positive ones due documentation and evaluation requirements and owing to the establishment of a European AI board and a public database; negative ones for unclear definitions, the missing right to compensation, numerous exceptions, and the "missed opportunity to draw red lines for certain technologies."¹⁸⁸⁷ Unsolicited codices, optional self-regulation, or ethics rules may not be sufficient to mitigate the risks posed by Big Data, automated decision-making, and Artificial Intelligence because AI applications may have an impact on human rights, and most importantly, not the private sector, but the state and the legislature are called to protect individual's fundamental rights. Consequently, new controls are needed such as external audits, specialist oversight bodies, technical standards, and public registries – steps which are already foreseen in some legislative drafts for the future regulation of Artificial Intelligence. This shall be welcomed since "legislative history in the course of industrial revolutions and across various sectors, be it transportation, chemical engineering, communications, aviation or biotechnology and digitization has shown that voluntary codes or self-regulation may simply not work, and that regulatory discussions should not primarily focus on specific harms or individual risks but also take the systemic and structural risk of Artificial Intelligence into consideration."¹⁸⁸⁸ Given the potential risks of AI, it is time to treat this technology like any other potentially hazardous technology, that is, enforce and enhance comprehensive

regulation and risk mitigation, taking into consideration existing privacy, security, product, liability, machinery, consumer, e-commerce, employment, anti-discrimination as well as any other applicable data-, purpose-, or sector specific laws and corresponding legal initiatives around the use of Big Data, ADM and AI into consideration. There are also interesting alternative approaches to issues that arise with the use of Algorithms and Artificial Intelligence such as the call for a Hippocratic oath for data scientists, and that may perhaps be truly needed as algorithms may promote depression and self-harm or even suicide: some authors raised their voice to underline that AI regulation shall address critical manipulative methods as there have already been cases in which it was reported that algorithms enforced teenager's depression with fatal consequences.¹⁸⁸⁹ One of the greatest challenges from a legislative and regulatory point of view is the failure to recognize¹⁸⁹⁰ that many of the new technologies not only pose challenges to individuals, but society, meaning that legal initiatives and approaches shall be adjusted accordingly, which is confirmed by the fact that Recital 4 says that “the processing of personal data should be designed to serve mankind.”.

Resources

This part of the Thesis provides an overview of relevant resources: conventions, regulations, directives, resolutions, trade agreements as well as non-binding initiatives, recommendations, and guidance at international, EU and non-governmental level, as well as various technical standards.

Conventions, declarations, and resolutions¹⁸⁹¹

Convention on Human Rights, available at https://www.echr.coe.int/Documents/Convention_ENG.pdf.

Convention for the Protection of Individuals with regards to Automatic Processing of Personal Data (Council of Europe Data Protection Convention – Convention 108) 1981 version available at <https://rm.coe.int/16808ade9d>.

Convention for the Protection of Individuals with regards to Automatic Processing of Personal Data (Council of Europe Data Protection Convention – Convention 108+). Modernized version available at <https://rm.coe.int/16808accf8>.

Charter of Fundamental Rights of the European Union, available at http://www.europarl.europa.eu/charter/pdf/text_en.pdf.

European Parliament Resolution with recommendations to the Commission on Civil Law Rules on Robotics (2015/2103(INL), available at https://www.europarl.europa.eu/doceo/document/TA-8-2017-0051_EN.html.

European Parliament Resolution with recommendations to the Commission on a civil liability regime for Artificial Intelligence (2020/2014(INL), available at https://www.europarl.europa.eu/doceo/document/TA-9-2020-0276_EN.html.

European Parliament Resolution on intellectual property rights for the development of Artificial Intelligence technologies (2020/2015(INI), available at https://www.europarl.europa.eu/doceo/document/TA-9-2020-0277_EN.html.

European Parliament Resolution with recommendations to the Commission on a framework of ethical aspects of Artificial Intelligence, robotics and related technologies (2020/2012(INL), available at https://www.europarl.europa.eu/doceo/document/TA-9-2020-0275_EN.html#:~:text=European%20Parliament%20resolution%20of%2020%20October%202020%20with,artificial%20intelligence%2C%20robotics%20and%20related%20technologies%20%282020%20F2012%20%28INL%29%29.

International Covenant on Civil and Political Rights, available at <https://treaties.un.org/doc/publication/unts/volume%20999/volume-999-i-14668-english.pdf>.

Organization for Economic Co-operation and Development Guidelines on the Protection of Privacy and Transborder Data Flows of Personal Data: 1980 version available at <http://www.oecd.org/sti/ieconomy/oecdguidelinesontheprivacyandtransborderflowsofpersonaldata.htm#guidelines>.

¹⁸⁹¹ This refers to conventions, declarations, and resolutions at international level.

Organization for Economic Co-operation and Development Guidelines on the Protection of Privacy and Transborder Data Flows of Personal Data: 2013 version available at http://www.oecd.org/sti/ieconomy/oecd_privacy_framework.pdf.

United Nations Convention on Certain Conventional Weapons, available at <https://www.un.org/disarmament/the-convention-on-certain-conventional-weapons/>.

United Nations Convention on Migrant Workers, available at <http://www.un.org/documents/ga/res/45/a45r158.htm>.

United Nations Convention on Rights of the Child, available at <http://www.un.org/documents/ga/res/44/a44r025.htm>.

United Nations Guidelines on Consumer Protection, available at https://unctad.org/en/PublicationsLibrary/ditccplpmisc2016d1_en.pdf.

United Nations Regulation on Automated Lane Keeping Systems (ALKS) available at <https://unece.org/sustainable-development/press/un-regulation-automated-lane-keeping-systems-alks-extended-trucks>.

United Nations Resolution on the Right to Privacy in the Digital Age, available at https://digitallibrary.un.org/record/848969/files/A_C-3_71_L-39_Rev-1-EN.pdf.

United Nations Universal Declaration of Human Rights, available at <http://www.un.org/en/universal-declaration-human-rights/index.html>.

Vienna Convention on Road Traffic, available at <https://globalautoregs.com/rules/157-1968-vienna-convention-on-road-traffic?show=agreements>.

Global trade agreements

Comprehensive Economic and Trade Agreement (CETA) between Canada and the European Union, available at https://trade.ec.europa.eu/doclib/docs/2014/september/tradoc_152806.pdf.

Comprehensive and Progressive Agreement for Trans-Pacific Partnership (CPTPP), available at <https://www.dfat.gov.au/trade/agreements/in-force/cptpp/official-documents/Pages/official-documents>.

World Trade Organization's General Agreement on Trade and Services (GATS), available at https://www.wto.org/english/tratop_e/serv_e/gatsintr_e.htm.

Directives and regulations¹⁸⁹²

Directive 95/46/EC of the European Parliament and of the Council on the protection of individuals with regard to the processing of personal data and on the free movement of such data, available at <https://eur-lex.europa.eu/legal-content/EN/TXT/?uri=CELEX%3A31995L0046>.

Directive 96/9/EC of the European Parliament and of the Council on the legal protection of databases, available at <https://eur-lex.europa.eu/legal-content/EN/ALL/?uri=CELEX%3A31996L0009>.

Directive 98/44/EC on the legal protection of biotechnological inventions is available at <https://eur-lex.europa.eu/legal-content/EN/TXT/?uri=CELEX:31998L0044>.

¹⁸⁹² This refers to directives and regulations at EU level.

Directive 2000/78/EC establishing a general framework for equal treatment in employment and occupation. available at <https://eur-lex.europa.eu/legal-content/EN/TXT/?uri=celex%3A32000L0078>.

Directive 2000/43/EC on equal treatment and against discrimination and Directive 2004/113/EC on equality in the access to and supply of goods and services, available at <https://eur-lex.europa.eu/LexUriServ/LexUriServ.do?uri=CELEX:32000L0043:en:HTML>.

Directive 2002/58/EC of the European Parliament and of the Council concerning the processing of personal data and the protection of privacy in the electronic communications sector, available at <https://eur-lex.europa.eu/legal-content/EN/ALL/?uri=CELEX%3A32002L0058>.

Directive 2006/24/EC of the European Parliament and of the Council on the retention of data generated or processed in connection with the provision of publicly available electronic communications services or of public communications networks and amending Directive 2002/58/EC, available at <https://eur-lex.europa.eu/LexUriServ/LexUriServ.do?uri=OJ:L:2006:105:0054:0063:EN:PDF>.

Directive 2006/54/EC of the European Parliament and of the Council on the implementation of the principle of equal opportunities and equal treatment of men and women in matters of employment and occupation, available at <https://eur-lex.europa.eu/legal-content/EN/TXT/?uri=CELEX%3A32006L0054>.

Directive 2009/22/EC of the European Parliament and of the Council of 23 April 2009 on injunctions for the protection of consumers' interests, available at <https://eur-lex.europa.eu/legal-content/EN/TXT/?uri=celex:32009L0022>.

Directive 2009/43/EC on intra-EU transfers of defense-related products, available at https://ec.europa.eu/growth/sectors/defence/transfers-products_en#:~:text=The%20transfer%20directive%20Directive%202009%2F43%2FEC%20on%20intra-EU%20transfers,for%20transfers%20of%20defence-related%20products%20within%20the%20EU.

Directive 2014/65/EU of the European Parliament and of the Council on markets in financial instruments, available at <https://eur-lex.europa.eu/legal-content/EN/TXT/?uri=CELEX:32014L0065>.

Directive 2016/680 of the European Parliament and of the Council of on the protection of natural persons with regard to the processing of personal data by competent authorities for the purposes of the prevention, investigation, detection or prosecution of criminal offences or the execution of criminal penalties, and on the free movement of such data, available at https://eur-lex.europa.eu/legal-content/EN/TXT/?uri=uriserv:OJ.L_.2016.119.01.0089.01.ENG.
